Very poor analogy. You could close borders forever and an endemic virus would re-emerge & spread. There's no logic to any of what they're doing. Viruses aren't like weather: they don't blow over until herd immunity is reached.

It doesn't work like that, they don't balance each other out at all.
With low true prevalence this test will throw out a majority of false positives, which cannot be compensated by testing more people.

The dreaded 'R' ? Seems like the public opinion is turning slightly towards the sensible in recent weeks though . I hope the pressure starts coming in strong to end this madness

1

dd @subsix848 · 7m

What is the "R"?

1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @subsix848 @truthVSworld and 2 others

It's irrelevant when 'cases' are not a representative sample. It's not valid just to divide the results of one weeks mass testing with the previous week imagine they're both v low, lower than the false positive rate. A few more tests & bingo, R>1, but nothing is really happening.

That's now gone to the upper echelons of the NHS. The reason I was found was that I'm good mates with my friend who shares a hobby with my NHS contact. If I get zero traction, I will redact bits that my contact doesn't want to have published, then tout my story around the papers.

Where was the breaking news story when it was concluded that around 80% of the infections were acquired in hospitals & care homes?
Yet we locked down the other 98% of those in neither such location, then scratched their heads when that didn't work?

My daughter told me she heard it on the news.
I'm going to ask for the source, because I can't find it. It wouldn't be surprising but that's not the issue, which would be recognition of just how nosocomial it is.

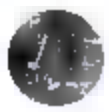
I've been thinking about the end game. It will not be possible for much longer to give the false impression that covid19 is running out of control. To get the cases uk even higher, they'll need more tests than is practicable. What will they do then?

5 8 20



Tupac Amaru IV @TheRealDjKuT · 11h
When people start to get colds and flus over the winter period, these will be diagnosed as Corona virus. The whole cycle will start again, this time I predict much harsher regulations 😤

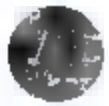
There will be some who will say, about the description below, "you can't prove that. It might be detecting real, current infections". Well, yes. But it's much more likely that the dynamics of viral decay follows precedent. As an explanation, it meshes with all the other data.



Willow Wise ✚ MakeEnglandGreatAgain @WillowW...
Replying to @SkyNews

Well that makes sense. Recovered people have stopped shedding viral fragments so false positives will decline.

I'm no fan of the WHO or the global response to Covid, but this is a non-story. If you post anything in the public domain, people are entitled to collect and analyse it. Makes sense they'd want to know what people are saying about the pandemic.

1

Yardley Yeadon
@MichaelYeadon3

Replying to @ThadMichaels

Of course, you're right. In PD, anyone w enough cash can pay to collect, analyse & counter. One reason I find it creepy is that they haven't covered themselves in glory. If WHO asserts something, I ignore it unless they provide literature references. In short, I don't trust WHO.

We have had exactly this discussion & outcome, many times, in my home. My wife knows that I'm a good scientist & she knows how ashen-faced I've been while doing my best to find innocent or well intentioned rationales for anything Govt has done. There isn't one & never has been.

In brief, expert judgement or opinions aren't the point. It's a matter of fact that, without separate confirmation of the FPR, it's assumed to be mid-pack compared with dozens of similar assays.

The operational false positive rate of the widely used PCR test is so large that ALL the mass testing data since June should be flushed. Think of cities & areas locked down needlessly? And both SAGE & HMG have known about this for at least 3 months.

How relevant / applicable is this paper given the SARS EQA's from 2004? Will procedures reducing cross contamination not potentially have improved since this? Genuinely interested to learn as not my area of speciality at all 🙏

It's rather remarkable that there's no official statistical & QA on the assay. A very simple operational fix exists now & it's what was done internationally with earlier PCR tests for viruses: re-test all the positives & any symptomatic negatives (false negatives are an issue..

I expect they've not disclosed the number of tests but at a hunch I'm going to guess 10x more. They really shouldn't release pseudo stats like X cases per unit of population. Unless they've tested each time a representative sample, it's false to state it like this.

Huw Williams @hwilliamssomers · 3h

How credible are the authors? They don't exactly look like the experts one would hope would be speaking out.

2

Yardley Yeadon @MichaelYeadon3 · 37m

Actually, all the authors of this internal doc are saying are things that are ALWAYS true of RT-PCR. They provide extensive references to support that, and they point out that this weakness has been recognised & accommodated previously by repeating tests on positive.

2

Huw Williams @hwilliamssomers · 28m

I get all this. But wouldn't it be 'better' if one of the UK's most senior scientists in the relevant field has authored this - for credibility?

1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @hwilliamssomers

Not really, no. If you don't understand that failing routinely to retest positives, like ONS does in their surveys, high FP result, I'm not sure that a senior person saying it is more persuasive:)

22 166 280

Dan Walker @dw229 · 2h
The FPR is clearly an issue for understanding the pandemic but this test may be the best we can do right now. And your alternative - stop all testing - is crazy. Then we'd have no idea whatsoever how many people have Covid.., How will that help save lives??

2

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @dw229

The test as deployed doesn't even find positives! They're hidden under scores of FPs!
My preferred solution is simple; retest all positives. That's what has always been done in the past.
And it would be fine to stop tests because almost no one has the virus. R is 0.2 (Ferguson).

Actually they don't track each other.

You'd expect the proportion of positive tests to decline substantially if the actual number if cases were not growing but that hasn't happened.

It's quite clear the actual number of infections has been growing (until very recently).

2

Yardley Yeadon
@MichaelYeadon3

Replying to @Rolo_Tamasi @MichaelBrailsfo @latimeralder

The proportion of tests which are positive fell relentlessly until late June. Now it's plateaued at around 0.5-0.7% and not moved in 2mo. It's the false positive rate. Virus has all but disappeared (ONS survey uses different & much more accurate methodology).

Professor Karol Sikora @ProfKarolSikora · Aug 27

Reports this morning estimate that around 15 million people are on the 'hidden waiting list'.

This tallies up with my thoughts, it is far worse than people think unfortunately.

Preparing for a potential second wave is one thing, this crisis is with us already. Gov needs to act.

117 498 2.2K

Yardley Yeadon @MichaelYeadon3 · 2h

Professor, according to my senior contact in NHS England, the #1 priority for the NHS is to
"keep NHS loadings as low as practicable, so as to cope with the 2nd wave".
There is no plan to normalise NHS services until the spring.
What do you say to this?

4 8 22

Robert Hudson @RobertH27576599 · 1h

That would condemn thousands with cancer and other diseases to death.

Show this thread

8 19 63

Robert Hudson @RobertH27576599 · 5h
Is this different than the 0.7% false positive rate? If you work the numbers from that then a good proportion of 'cases' are false.

Yardley Yeadon @MichaelYeadon3 · 53m
I wrote a 15 page, 30 reference position paper. It majored in high likelihood that the pandemic episode is all but compare; why that probably is; that no biological law guides to predict a 2nd wave. So, normalise the NHS & refine or terminate mass testing.

1

Robert Hudson @RobertH27576599 · 48m
CEBM said that there was no evidence for a second wave. They are usually right. From following various profs it looks like Covid will come every winter and take a few thousand, just like flu. May not even be a net increase in deaths as you can only die once.

Who do you believe on a 2nd wave? Prof Heneghan at the Centre for Evidence Based Med, or Prof Ferguson. Latter predicted 500k deaths. It's under 50k. He said lockdown would massively reduce transmission. It's now accepted it was ineffective. He's no skills to predict 2nd waves.

Robert Hudson @RobertH27576599

I agree it can't distinguish live SARS-COV-2 & degraded bits of RNA.
It definitely doesn't cross react with the common cold, measles or Ebola. They chose primers (bait) to stick to sequences unique to the target virus. It works well, but it was never designed for mass screening.

renders the result meaningless.

1 1

Bea Johanssen @bea_johanssen · 23m

Then every test used by every health authority across the globe is 'meaningless'.

2

Norma Leespeaking @NLeespeaking · 17m

No. It depends on sample size, the likelihood of an event happening and the accuracy of the test. It's complicated. But in the case of 'Coronavirus', the likelihood of infection, the sample size and the accuracy of the test certainly makes the results 'inconclusive' at best.

1 1

Bea Johanssen @bea_johanssen · 10m

I understand statistics and probability.

PCR tests for current infection. If 200,000 tests per day are carried out, as at present, and, say, 1,000 of those are positive then 50 are likely to be inaccurate.

PHE can estimate the rate of infection as 0.475-0.5%.

At 5% false positives & prevalence of 0.1%, a screen of 1000 will yield 50 false positives & maybe 1 genuine.

2

Bea Johanssen @bea_johanssen · 6m

It is inflammatory and overstates the issue.

If tests consistently give 5% false negative/false positive, then the rate of infection is irrelevant: for every 100 tests, 5 will be inaccurate.

The rate of infection can be modelled accurately enough from there.

1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @bea_johanssen @NLeespeaking @DarrenPlymouth

You're not thinking clearly.
If the true incidence of that which you're seeking to measure is 0.1% (it's lower) you won't get 1 positive per thousand tests, but 51 (ignoring the negatives for now). If the prevalence doubled, a big deal, you'd see 52 positives. Utterly useless.

I don't understand how less testing increases the positives. If our colors are based on number of new cases what happens if everyone just stops getting tested? I don't get this. Please help

1

BFE @BrettEwing · 49m
Less testing increases positivity rate.. the CDC recently has said if you have been around someone that has tested positive and you don't have symptoms, then no need to get tested... 180 degrees from the last four months. Do I need to give you the math behind it?

2

M P Sorensen @sorensenpat52 · 9m
Have you factored in false positive rates? Or the fact that the test picks up fragments of the virus up to 12 weeks past infection. Thus a positive result today which increases a county's rate per 100K, might be up to 3 months old and no longer valid.

U.K. here, our mass screen's exposed as a sham, as the PCR false positive rate is roughly 10x the true prevalence. They're now running 160,000 tests per day & routinely finding 1500 "new cases" per day, none with symptoms: hospitalisations, ICU use & deaths all continue falling.

R is NOT above 1.
All of U.K. population screening data is invalid because the false positive rate is approx 10x the true prevalence. This is why they all lack symptoms & don't get ill.
Any R derived from that 'data' is wrong.

Different infectious organism.
Covid19 isn't mutating.
There is now law or biological equilibrium which makes waves inevitable or, as in this case, even likely.
The 2nd wave meme is semi religious with no scientific underpinnings.

Something wrong with the numbers. I don't believe nearly 1000 new hospitalisations for covid19 in a day. If say 3% need hospital, that's 30,000 new infections in a day. Theoretically possible, but only if several hundred the prior day & so on. Anyone know?

This is what I was fulminating about yesterday.
Our mass testing regime, with an unspecified false positive rate, which cannot be less than 0.5% & is probably higher, with prevalence of virus of around 0.05% (ONS survey), can only generate 95% false positives.
It's foolhardy.

Who do you believe on a 2nd wave? Prof Heneghan at the Centre for Evidence Based Med, or Prof Ferguson. Latter predicted 500k deaths. It's under 50k. He said lockdown would massively reduce transmission. It's now accepted it was ineffective. He's no skills to predict 2nd waves.

> **Robert Hudson** @RobertH27576599
> Replying to @MichaelYeadon3
> CEBM said that there was no evidence for a second wave. They are usually right. From following various profs it looks like Covid will come every winter and take a few thousand, just like flu. May not even be a net increase in deaths as you can only die once.

4 9 41

DavidM @DavemRizzo · 4h
Going by the mix of opinions I don't think it has been accepted that lockdown was ineffective. The 'many thousands that would've died without lockdown' varies. Social distancing has always been an option apart from public transport & supermarkets when no queuing & scrums 4 pasta

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @DavemRizzo

I wonder if you've read around this topic at all? It's absolutely clear that R was well below 1 BEFORE lockdown. It's widely accepted that the internal between lockdown & the peak daily deaths is way too short for LD to have influenced deaths & therefore the preceding infections.

I would always take Heneghan over Ferguson. Only one of them has had a Good War.

1 1

Zugzwang @zugzwang2007 · 5h

Theory and history of Second Waves is interesting, in contrast to (a) further legs of a First Wave that has not been extinguished (such as may be starting in France) or (b) seasonality effects.

1 1

Zugzwang @zugzwang2007 · 5h

It is possible that people who are asymptomatic now may become symptomatic as temperature falls and humidity drops. But that is not a 2W, although it could seed one if such people become (more) infectious. Effect would be second order, not like 2W of Spanish Flu.

1

Zugzwang @zugzwang2007 · 5h

It is also possible we might get a second leg (following France) although the latest ONS survey numbers strongly suggest that the numbers testing positive in their study are very close to the noise floor, at a steady 0.5%, so this seems unlikely.

2

Yardley Yeadon

It is also possible we might get a second leg (following France) although the latest ONS survey numbers strongly suggest that the numbers testing positive in their study are very close to the noise floor, at a steady 0.5%, so this seems unlikely.

Zugzwang @zugzwang2007 · 5h

The two reasons for a real "1919"-style 2W would be loss of immunity, while virus still circulating, and/or sufficient mutation to allow the recovered to be reinfected en masse. Recent reports of reinfections are not yet enough to cause great concern on either score.

Actually, and more seriously, I can imagine R being greater in cold weather with more indoor living. If correct, the HIT will be higher. We should anticipate an additional outbreak until enough have been taken out of the susceptible pool sufficient to return R to below 1.

Our mass testing regime, with an unspecified false positive rate, which cannot be less than 0.5% & is probably higher, with prevalence of virus of around 0.05% (ONS survey), can only generate 95% false positives.
It's foolhardy.

the ignorant asymptomatic CV19 testing. Positive asymptomatic Covids may be infectious for 1 week and still test positive for another month. Contact tracing asymptomatics is impossible. AMA is political.

1

Allen @miscreantmd · Aug 28

CDC Director, Robert Redfield, caves to political pressure. Now close contacts of confirmed or probable Covid Cases should consider getting tested. This is all the purveyors of panic need to continue widespread asymptomatic lockdowns. This is not a rational scientific decision.

Allen @miscreantmd · 5m

Asymptomatic cases may be infectious for one week, but will test positive by PCR for another month. 80% of true positive asymptomatic cases are not infectious based on the timing of the test. Tracking asymptomatic contacts is foolish and promotes intended hysterical lockdowns.

> **Yardley Yeadon** @MichaelYeadon3
> .. testing programmes by examining data from published external quality assessments (EQAs) for RT-PCR assays for other RNA viruses carried out between 2004-2019 [7]. Results of 43 EQAs were examined, giving a median false positive rate of 2.3% (interquartile range 0.8-4.0%)."

Andrew Norton @ajnorton3 · 36m
So If those are plausibly ALL false positives doesn't that set an upper limit for the F.P. rate? Struggling to understand otherwise...

2 1

Zugzwang @zugzwang2007 · 30m
I think it does set an upper bound, which is explained by the unofficial report that they test 3x before recording a positive, so the probability of a false positive is proportional to the cube of the rate for single tests.

1 1

Replying to @zugzwang2007 @ajnorton3

It's not only good practise by ONS if that's what they are doing.
It's NORMAL. In all prior infectious outbreaks round the world, where PCR was used, they ALWAYS had more that a single PCR test before declaring a 'case'.
Our SOP would embarrass Mickey Mouse!

Yardley Yeadon @MichaelYeadon3 · Aug 28
medrxiv.org/content/10.110...
The operational false positive rate of the widely used PCR test is so large that ALL the mass testing data since June should be flushed. Think of cities & areas locked down needlessly? And both SAGE & HMG have known about this for at least 3 months.

Would someone from SAGE or the BBC outline how a '2nd wave' could arise in U.K.? In answering, please also describe how it is that despite release from LD, street protests, crowded beaches etc all the indeces have declined to under 1% of peak (hospitalisation, ICU use, deaths).

The first wave was real enough. No question. The so called second wave is wholly a function of misusing in a mass testing context a PCR assay which has a false positive rate rendering it useless for its surveillance role.
Almost all recent, community test positives are false.

Would someone from SAGE or the BBC outline how a '2nd wave' could arise in U.K.?

In answering, please also describe how it is that despite release from LD, street protests, crowded beaches etc all the indeces have declined to under 1% of peak (hospitalisation, ICU use, deaths).

15 32 132

MB @markbishopuk · 1h

One possibility is winter. Virus attenuation may be seasonal, and transmission is likely higher, and viral load greater, indoors

I agree with you. I think it's entirely possible that R0 will be somewhat greater in cold weather. Since the proportion of people who must be able to participate in transmission to sustain an outbreak would then be smaller, it would be reasonable to expect an additional, small..

The first wave was real enough. No question.
The so called second wave is wholly a function of misusing in a mass testing context a PCR assay which has a false positive rate rendering it useless for its surveillance role.
Almost all recent, community test positives are false.

2 4 19

samedaydoctor @samedaydoctorUK · 47m

We are seeing a few positives- but none of the patients is ill in any way- this is not asymptomatic disease- routine testing for travel purposes. ? False positive or harmless carriage of virus?

1 2 1

Yardley Yeadon

@MichaelYeadon3

Follow

Replying to @samedaydoctorUK @Fr33Sp33ch5 and 2 others

I would say false positives. I'm not sure it's possible for there to be harmless carriage. If you're immune & then exposed to the virus, you will fight it.

So who are to be the global overlords? Why would they want to be in charge of a planet?
There's nothing gained like this for people with billions. They'll make their own lives very restricted, too.
Also, let me guess: those in charge are called Rothschild, yes?

Antibody half-life for cov2 is very short. In a study that SpaceX did working with Harvard epidemiology, it appears to be as low as 2 or 3 weeks. Nonetheless, reinfection rates are very low & symptoms are minor, perhaps due to memory T cells en.m.wikipedia.org/wiki/Memory_T_...

43 90 613

Some evidence regarding the importance of T cells in antiviral memory comes from a study of survivors of the 2003 SARS outbreak. All who were tested this year had circulating T cells responsive (IIRC) to SARS-COV-2 (perhaps to SARS), the point being 17y presumptive memory.

That's good. It's really not necessary to have circulating levels of antibodies sufficient to protect you from an infectious agent. Consider to how many things you have immunity. There's only so many mg/ml total protein in serum & most of that is albumin & clotting factors.

John Rentoul @JohnRentoul · 4h

Important paper on coronavirus death rates suggests effects of govt measures (eg distancing) have been "substantially" overstated HT @tylercowen
minneapolisfed.org/research/sr/sr…

> We document four facts about the COVID-19 pandemic worldwide relevant for those studying the impact of non-pharmaceutical interventions (NPIs) on COVID-19 transmission. First: across all countries and U.S. states that we study, the growth rates of daily deaths from COVID-19 fell from a wide range of initially high levels to levels close to zero within 20–30 days after each region experienced 25 cumulative deaths. Second: after this initial period, growth rates of daily deaths have hovered around zero or below everywhere in the world. Third: the cross section standard deviation of growth rates of daily deaths across locations fell very rapidly in the first 30 days of the epidemic and has remained at a relatively low level since then. Fourth: when interpreted through a range of epidemiological models, these first three facts about the growth rate of COVID deaths imply that both the effective reproduction numbers and transmission rates of COVID-19 fell from widely dispersed initial levels and the effective reproduction number has hovered around one after the first 30 days of the epidemic virtually everywhere in the world. We argue that failing to account for these four stylized facts may result in overstating the importance of policy mandated NPIs for shaping the progression of this deadly pandemic.

John Rentoul @JohnRentoul · 4h

Important paper on coronavirus death rates suggests effects of govt measures (eg distancing) have been "substantially" overstated HT @tylercowen
minneapolisfed.org/research/sr/sr…

> We document four facts about the COVID-19 pandemic worldwide relevant for those studying the impact of non-pharmaceutical interventions (NPIs) on COVID-19 transmission. First: across all countries and U.S. states that we study, the growth rates of daily deaths from COVID-19 fell from a wide range of initially high levels to levels close to zero within 20–30 days after each region experienced 25 cumulative deaths. Second: after this initial period, growth rates of daily deaths have hovered around zero or below everywhere in the world. Third: the cross section standard deviation of growth rates of daily deaths across locations fell very rapidly in the first 30 days of the epidemic and has remained at a relatively low level since then. Fourth: when interpreted through a range of epidemiological models, these first three facts about the growth rate of COVID deaths imply that both the effective reproduction numbers and transmission rates of COVID-19 fell from widely dispersed initial levels and the effective reproduction number has hovered around one after the first 30 days of the epidemic virtually everywhere in the world. We argue that failing to account for these four stylized facts may result in overstating the importance of policy mandated NPIs for shaping the progression of this deadly pandemic.

I'm glad you're again highlighting this. It's been well understood by those students of this local & global mess for very many months.
Not a single thing we did or were required to do or not do made a blind bit of difference to the outcomes.
Now can we please lift every measure?

The strongest practical argument against extending what are War Powers, essentially, is they've misused them repeatedly.
Multiple, independent analyses show that not one of them has been beneficial.
Set against this zero is the stupendous costs in money, human lives & society.

The aspect of BBC behaviour this past six months is their willingness to lie about everything to do with the pandemic. Also to use a 'science' or 'medical correspondents' who've not the slightest clue about either. They've questioned nothing, as though U.K. exists in a vacuum.

It is only a matter of time before the BBC is second to online media outlets (if not already)

If the BBC is to survive in any format, it needs to become a subscription only channel.
People no longer see a need for a TV Licence

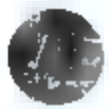
Ps: it will be buried under the seasonal influenza illnesses & deaths. Though if this seasonal flu should take fewer elderly people than usual as many of those likely to die have already died - RIP.



1 3

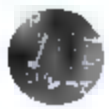
MB @markbishopuk · 3h

Seems to me the measure that matters is not number of cases but severity, for which those hospitalised is the best proxy. My fear is a reversal of attenuation caused by season change combined with higher viral load resulting from more indoor and closed-window settings

2 1

Yardley Yeadon @MichaelYeadon3 · 3h

That's all possible. Is there any evidence from slightly more northern latitudes or those in the antipodes? Obviously, absence of evidence isn't evidence of absence, but it helps :)
I still calculate that a large, growing outbreak in U.K. is biologically implausible. Fingers x'd!



1 1 2

MB @markbishopuk · 2h

Correlation isn't causation but there do seem to be a lot of cases and deaths in some South American countries, especially those further south and with many living at high altitude and therefore having just passed through a cold season. Peru and Chile I understand hit badly

Does the timing of those remarks in SAGE minutes & of this 'campaign coordination' in print media match up? I've not seen authentic dates for either.
It's the "trust but check" phenotype in me :)

If this is true, it's truly appalling. If Govt was to choose a campaign of misinformation, we'd not know (except the cognitive dissonance might be a giveaway).
Also, let me guess: this Govt edict applied to broadcast media?

I have heard from a highly qualified & involved colleague that the PCR test is now being run to a greater number of cycles, ostensibly to make sure they don't miss cases. In practise it greatly increases the false positive rate thus inflating "case" numbers.

Do you know would orders as to number of cycles come from government, PHE or other ? do each lab testing decide their own number of cycles or are they given a target number to find? If all changed cycles at the same time would that show in % positivity figures against tests?

There is absolutely no doubt, this is a deliberate policy, orchestrated from a central point.
There is zero chance that qualified people running PCR don't know you'd lose your job as a lab tech & get all your papers withdrawn if it became known that this is how you did your PCR.

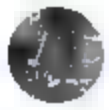
miss cases. In practise it greatly increases the false positive rate thus inflating "case" numbers.

16 97 246

MB @markbishopuk · 8h

Surely case stats could be reported by number of cycles needed to generate positives

1 3



Jen @leoniedelt · 6h

I think every single result from March onwards need sto be evaluated based on the Ct and if its > than say 25, they need to be binned

I guarantee a massive number from June onwards would be changed to negative.

6

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @leoniedelt @markbishopuk @RealDeniseWelch

I second a Ct cutoff of 25. That matches Bullard et al (2020), who found it wasn't possible to culture virus from clinical samples if that many cycles were needed for a "weak positive".

I have heard from a highly qualified & involved colleague that the PCR test is now being run to a greater number of cycles, ostensibly to make sure they don't miss cases. In practise it greatly increases the false positive rate thus inflating "case" numbers.

16 97 247

Nigel Bennett @top1percentile · 6h
"Up to 90 per cent of people diagnosed with coronavirus may not be carrying enough of it to infect anyone else, study finds as experts say tests are too sensitive"
Just imagine if the Govt could include that lot in the 'case' numbers. Then it would be nonsense & masks till 2030.

2 2 3

Yardley Yeadon

all this is intentional to usher in NWO.

The Covid-Plan / Rockefeller Lockstep 2010

They hypothesize a smallpox global outbreak required steps: ...

- Create a very dangerous but super transmissible strain of the revealed plan ...
- Fund an existing international body such as the World Health Organization (WHO), the CDC and ask them that scientists involved with pandemic response prepare for the planned release of the fictitious SARS-like virus ...
- Create and fund the vaccination development and roll out plan so it's capable of being rolled out on a global scale. Cite: A Decade of Vaccines and the Global Action Vaccine action plan, 2011 to 2020
- Create and fund the vaccination verification and certification protocols ...
- Simulate the lockdown food rioting prior to the planned Event 201 ...
- Develop the logistics to move populations to designated locations ...
- Once a country has been shown to have some sort of ongoing viral ... spreading as long as possible.
- Once enough people in a country/region are infected, enact forced quarantine/isolation for that area and expand the lockdown region slowly over time ...

1

John Carroll @JohnCarroll49 · Aug 30

Sorry - it was actually 509 deaths on 23rd March, with 149 deaths that day. My mistake. But the point is that it was doubling every 3 days. The death rate peaked at around 10th April, and then dropped rapidly. Why, if not cos of lockdown?

2

Luke King @Coolhandluke_25 · Aug 30

Because the virus ran it's course. Gompertz curve I believe it's called in medical circles

1 1

John Carroll @JohnCarroll49 · Aug 30

Except that it didn't. The only way for the virus to "run it's course" is for us to reach herd immunity. Without vaccinations, that would need about 60% of the population to have had it. We're nowhere near that.

2

Yardley Yeadon

@MichaelYeadon3

Follow

Replying to @JohnCarroll49 @Coolhandluke_25 and 3 others

John, pls stop. You're badly embarrassing yourself. Why 65%? That herd immunity threshold is based on the incorrect Imperial assumption that 100% of the pop were susceptible. It's clearly not true. Gupta & Gomez show that under 20% infected reaches HIT, which is where we are.

... than when schools were in session."

8 210 646

Newman Nahas @NahasNewman · Jul 16

7/ Thus, the idea that we can't open schools until we first contain spread is irrational. Open schools aren't the problem; closed schools aren't the solution.

It is like a community saying we can't open gay bars till the incidence of unplanned pregnancy is under control.

14 218 751

Newman Nahas @NahasNewman · Jul 16

8/ This whole thing is not just unsound but stunning in its sheer cynicism.

Keeping the aristocracy online, plump, amply toilet-papered, quaffed, pedicured: essential enough to risk increased transmission.

But schools, nah?

The judgment of history is coming.

47 232 873

Craven Brutalier @CarvinBiggler · Jul 17

Cool let's throw caution to the wind and see what happens should be fun. Why be on the safe side with kids when there's a deadly virus circulating?

5

We Want to Live @WeWanttoLive5 · Jul 17
Deadly virus circulating - are talking about the flu? There have been 14 deaths with COVID reported among children age 5 to 14 since February 1st. In the same time period there have been 47 flu deaths and 72 pneumonia deaths among children.

1 7

Craven Brutalist @CarvinBiggler · Jul 19
Cool kids are just numbers

1

Emily Petro @EmilyPetro22 · Jul 21
Then we'll have to close schools forever.

1 2

Craven Brutalist @CarvinBiggler · Jul 22
Maybe just wait a few months for a vaccine?

2

Ferguson's model & the predictions it makes have completely captured SAGE & HMG.
This is why they're ramping tests to 1/3rd million per day.
This generates many 1000s of false positives per day & is used to justify access restrictions INCLUDING to the NHS.
I don't know why.

So what? Test people early in the evolution of infection & lo and beyond, no symptoms, but a highly sensitive PCR finds a few strands of RNA.
To be infectious you need to have grown up copious amounts of virus. At that time you WILL have symptoms. That's how biology works.

He has ZERO qualifications to construct transmission models then inflict the output on us.
He's probably an average theoretical physicist. He's no biologist, medic, virologist or anything faintly relevant.
He adopts assumptions that A level biology students know are unreasonable.

If you'd read any serious literature on the topic, you'd know that lockdown saved no one in U.K. & Govt accepts that. Prof Whitty (UK CMO) agreed that infection rate had turned & was falling fast, BEFORE lockdown. Lockdown was superfluous (no blame attaches, couldn't know that).

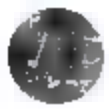
Yardley Yeadon @MichaelYeadon3 · 3h

Pls read below.
Are you persuaded now that Covid19 is self limiting & requires no human intervention?
No masks, no lockdown, just herd immunity, as Johan Giesecke predicted?
No vaccine (except perhaps for a few highly vulnerable people)?
Don't let others tell you otherwise.

> **Dolphin** @dolphinsnodoll
> Replying to @dolphinsnodoll @speedster1857
> Havg said that Corona death in Sweden yesterday:0, at hospital:0, at ICU:0, fell sick: 253...quite promising. Note that no lock-down and masks-up throughout

1 19 45



Greenflame @Greenfl77507104 · 3h

Correct, just proper ventilation in vulnerable population, like elderly care homes. The other people can cope with the disease.

But as a precaution make Leronlimab available for the mild/moderatily ill people. MHRA has to make a decision on that now.

1 2

Yardley Yeadon

Yes, it's called cheating with PCR. For weeks, possibly months, non functional, broken fragments of viral RNA persist in the body of a person who long since vanquished the disease. Run PCR too many cycles & you find them all. I call this a 'hot false positive'.

Michael James @RephreshedMind · 18h
I've asked my health department what cycle threshold they are using but as expected I haven't heard a peep. The lack of transparency is astonishing, we the people deserve to know what amplification level our state is using. Makes quite difference when examining "cases".

7 2 13

RIArcange111o @Ephesians6__12 · 18h
The entire foundation for this scam is built on the PCR test which was never meant to be a diagnostic test and which can easily be manipulated by the choice of the number of amplification cycles or by raising or lowering the threshold value that defines a positive result...SCAM

1 2 10

Michael James @RephreshedMind · 18h
Absolutely, and the fact that they don't even have the decency to tell us what threshold they are using is absurd. It should be made clearly known to the public, otherwise all we can assume is that it is an easily manipulated scam like you said.

1 1 5

RIArcange111o @Ephesians6__12 · 18h
All tests for S-C2 are unreliable and scientifically invalidated...hence, associated statistics on incidence and mortality are fraudulent..but unfortunately EVERYONE has been operating under the false premise that the stats are legit.

Prof Carl Heneghan is about to publish this week papers showing unequivocally that Ct > 30 aren't infectious.
As all U.K. screens are run to Ct = 40, it's all junk, as I said a couple of days ago.
A good hospital test, but a truly dreadful mass surveillance test.

1 3 12

Zugzwang @zugzwang2007 · 41m
Both parts of this are remarkable. I knew that the SOP had a cutoff at Ct=40, but not that they are all run that far. If there is now hard evidence that a positive test withi Ct>30 is not infectious, that is Game, Set, Match.

1

Yardley Yeadon @MichaelYeadon3 · 3m
According to Carl, with who, I discussed this today, he has papers out this week to this effect, comparing PCR positives at different cycle thresholds with ability to culture virus from clinical samples. I think he may have mentioned symptoms, too.
I'm not sure all samples are..

The operational false positive rate of the widely used PCR test is so large that ALL the mass testing data since June should be flushed. Think of cities & areas locked down needlessly? And both SAGE & HMG have known about this for at least 3 months.

65 693 1.1K

littleeaglesd @KevinHuckle · Aug 28

Leicestershire on 01/07 145 cases per 100k population, 26/08 1590 cases per 100k population. 10 x more cases, but no hospitalisation or deaths. 41 Covid related deaths since 24/06. The truth of data.

1 4 13

Yardley Yeadon @MichaelYeadon3 · Aug 28

I expect they've not disclosed the number of tests but at a hunch I'm going to guess 10x more. They really shouldn't release pseudo stats like X cases per unit of population. Unless they've tested each time a representative sample, it's false to state it like this.

1 1 8

littleeaglesd @KevinHuckle · Aug 28

Yes, it is unclear, but whatever the number of cases, they are not converting to hospitalisation or deaths, and as you know cases are the new deaths and Local Lockdowns are not justified. I can only see it leading to the golden egg of the vaccine and more.....

1 3

Yardley Yeadon
@MichaelYeadon3

Replying to @HelenMcArdle3 @EthicalSkeptic

Colds don't cross react in PCR for SARS-COV-2.
I think the vast majority of those tests with positive rate almost 1% must be the false positive rate of the PCR test as run there.
Reason: virus prevalence is around 0.05%, 1:2000. 1% is 20:2000. 95% are false positives. At least.

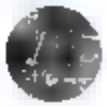
Nicole Soranzo @nicolesoranzo · Jun 27

I just took an COVID-19 Abbott antibody test (IGG) and it was negative - despite my viral test being positive back in March. Is this more likely to be a false negative, or does it mean that I did not develop antibodies? 🤦



47 31 199

Prof Francois Balloux @BallouxFrancois · Jun 27

Unless you had severe symptoms, it's likely that your neutralising antibody titres are now below detection level. There have been several recent preprints showing rapidly waning antibody levels. On the bright side, T-cell immune response to #SARSCoV2 looks long lived.

29 159 627

Yardley Yeadon
@MichaelYeadon3

Is the cycle that a test showed positive at actually in the test results or are we just basing this on the threshold for a positive test set by the lab itself?

1

Yardley Yeadon @MichaelYeadon3 · 49m
Not sure I understand your question. I know in mass testing of the well, PCR is routinely being run well behind credulity. We know from other work that Ct 30 is at the limit for infectivity confirmation & if neg at Ct 30, it's cheating to go on to call Ct40 'positive'.

1

TheConservativeDemocrat @ConseDemo · 39m
Answered my own question: We only know the cycle threshold on a lab basis because it's used as an input into how the test is run.

Like shaking a can of paint 30 times versus 40 to mix two colors together. I can't tell at which "shake" they actually blended, only that they did.

1

TheConservativeDemocrat @ConseDemo · 36m
I'm by no means an expert on PCR testing, but the more I read about how they work the more I'm actually horrified that we've been using them to make decisions in this way.

This isn't borderline criminal, people need to go to jail for this.

On BBCR4, Prof Neil Ferguson is banging on about frequent testing & Jeremy Hunt is emphasising the need to test school staff & children 2-3x per week. "Because 70% of transmission, sometimes lethally, is asymptomatic". These guys are lying. It's simply not true.

Prof Francois Balloux @BallouxFrancois · Jun 27

Unless you had severe symptoms, it's likely that your neutralising antibody titres are now below detection level. There have been several recent preprints showing rapidly waning antibody levels. On the bright side, T-cell immune response to #SARSCoV2 looks long lived.

29 159 629

Yardley Yeadon @MichaelYeadon3 · 41m

Francois, I too believe that antibody prevalence hugely underestimates the proportion of the population which has been infected.
If you were pressed...by what amount do you guess that seroprevalence underestimates population infection?
My own hunch is at least 2x and might be 3x.

1 3

Emily Petro @EmilyPetro22 · 4m

There was a study done by the Karolinska Institute...2 times as many people had Covid specific T-cells (not the same as cross-reactive) as Immunoglobulin antibodies (what the AB test measures)...so I'd say it's a good guess.

Testing those w/out symptoms, when virus prevalence is low (recent ONS 0.05%, 1 :2000), using a test with a false positive rate of at least 0.5% means we find 9 false positives for every genuine positive. Most genuine positives are not infectious or ill. PCR being misused. STOP!

I still don't understand why testing for live virus (unless sick) was seen as so important. But I never believed that we could control the virus in the wider population.

1 1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @Fuengi

We've NEVER sought live virus. PCR shows fragments of viral RNA, which persists >12w after infection. Only if PCR is positive with low cycle thresholds is the person likely infectious or even ill.
We're running PCR far too many cycles.
Almost all false +
Real cases close to 0.

Prof Carl Heneghan is about to publish this week papers showing unequivocally that Ct > 30 aren't infectious.
As all U.K. screens are run to Ct = 40, it's all junk, as I said a couple of days ago.
A good hospital test, but a truly dreadful mass surveillance test.

10 44 180

KR @Kieran17254040 · 6h
Fascinating. If all cases and deaths for ct>30 are tossed, I wonder how IFR will change?

Yardley Yeadon
@MichaelYeadon3
Follow

Replying to @Kieran17254040 @EthicalSkeptic

Good Q. No idea. Sure, the denominator would fall, increasing IFR. But true covid19 deaths wld also fall, reducing IFR. Net effect, I don't know.
No longer sure it matters as population fatality rate is the final impact. Heavily infected countries trend to 0.05% & then STOPS.

94 4 142

Gillianabeth @Gillianabeth · 2h
Follow Peter Hitchens and Simon Dolan. What is being done to children here is far more sinister than a virus most are shaking off, don't know they have (!?) recover from even if ill. Look at the stats for flu in UK, US and worldwide. Use your brain & research alt medical opinion.

2 3

Father Jack @FatherJack11 · 52m
@Gillianbeth the danger is not to the young but to more vulnerable members in society (over 50's) when the young are shedding this virus that is not actually harming them but can harm others in their family circle. These measures are to stop spread rather than to protect children

3

Yardley Yeadon
@MichaelYeadon3

Replying to @FatherJack11 @Gillianabeth and 3 others

The young are poor transmitters that virtually no case internationally has a family been infected initially by a child. We've known this since Wuhan. I read it in February & since then all track & trace findings support this. Open schools reduces risks, by shading R downwards.

Davo @Davo15375846 · 3h

Of course it reduces the risk, it filters the air that you breath in and out, it doesn't take much common sense to understand that, whether they actually need to be worn right now is a different matter.

2

Replying to @Davo15375846 @Iwontcalmdown and 2 others

It doesn't filter enough. You're pouring 30L of damp breath through it per minute. Fabric can't handle that, so most of it leaks airways. Glasses steam up, proving they all leak like crazy.
Clinical studies show they don't prevent transmission of influenza like illness.

5 5

Leah Butler-Smith #KeepBritainFree @LeahButlerSmith · 2h

Have it? You mean the seriously flawed tests said 'something'. And anyone who had had it - which is a very high percentage - is now part of herd immunity. So risk is neglible. Neglible. Do I need to repeat FACTS that make it negligible or leave it to you to discover?

2 13

UK Mushroom @derek_rocholl · 1h

Puttting the word FACTS is capital letters doesn't make a wild assertion factual. The credible evidence available suggests less than 10% of the population have had Covid19 and there are now confirmed cases of people of people getting in again. Stop lying.

Personally, I believe if we completely halt mass population testing & instead test only those with symptoms plus those in track & trace, the whole episode will be seen for what it is: OVER.

Test, test, test might have been appropriate early on. Now it's pointless & misleading.

I still don't understand why testing for live virus (unless sick) was seen as so important. But I never believed that we could control the virus in the wider population.

1 2

Yardley Yeadon @MichaelYeadon3 · 6h
We've NEVER sought live virus. PCR shows fragments of viral RNA, which persists >12w after infection. Only if PCR is positive with low cycle thresholds is the person likely infectious or even ill.
We're running PCR far too many cycles. Almost all false +
Real cases close to 0.

1 1

Mark Davison @Fuengi · 6h
Yep. I get there are huge problems with the current testing, although not to your level of understanding.

I can't see the rationale behind the thinking to test, even if the tests were perfect. You're never going to catch everyone, not even 50%. It was flawed methodology.

1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @Fuengi

Good point. I'm unsure what the rationale for mass testing is. If they're vulnerable & get ill, it will show up faster by paying attention to daily admissions stats (which I know they do do). Meanwhile if not ill, getting the virus takes us another baby step to herd immunity.

I agree with that, and I didn't claim it was. I mentioned it as an example of a person for whom covid19 notionally leaves no trace. In practise, with sufficiently sensitive methods, I'd have a small wager that there'll be fingerprints of past infection somewhere. Such people...

..virus by using innate immune processes, for example, targeted release of interferon, which can kill virus-infected (or certain cancer) cells. In such people, there may be no sign at all that they were ever infected.
You'll now prob not be surprised to learn that some people...

2

UK Mushroom @derek_rocholl · 40m
Targeted release of interferon isn't herd immunity. If there are efficacious treatments available we need them in widespread use before gambling with millions of people's well being again.

I meant endogenous interferon release & action, by the way.
As you'll probably be aware, there has been a small and apparently successful clinical trial of EXOGENOUS inhaled interferon by a small biotech I know at U Soton, called Synairgen. It shows what a powerful mech this is.

"40% of asymptomatic individuals became seronegative & 12.9% of the symptomatic group became negative for IgG in the early convalescent phase."

Comment: in community serology, half of those previously infected would be negative for antibodies.
There are several papers like this.

Wrong. You're relying on prevalence of antibodies. It's established only a small fraction of those infected go on to develop antibodies & in many cases the circulating levels wane fast.
Numbers infected are AT LEAST 3x greater than antibody prevalence.
We're at herd immunity.

3

UK Mushroom @derek_rocholl · 1h
If you haven't got antibodies for this virus you aren't immune, so the only way to measure of the level of immunity are antibody tests. On every score you are wrong. Herd immunity isn't in place and isn't likely to be achieved without mass vaccination.

1

Yardley Yeadon @MichaelYeadon3 · 1h
I believe you mean well, but I'm sorry, that's just completely incorrect. Depending on how much challenge your body experienced in overcoming the virus, you might have lots of circulating antibodies, or none at all. Both have been reported recently in the literature. As far as...

2

UK Mushroom @derek_rocholl · 1h
Again if you haven't got antibodies you aren't immuneto the virus. If you aren't immune you aren't capable of contributing to herd immunity. It isn't a difficult thing to understand.

2

Yardley Yeadon

The media could not be played.

28 539 799

Peter Faber @PeterFaberSP · Aug 31
That is simplistic too. Just because cases go up when masks are used more while testing more, doesn't mean it was the masks.

4 2

JP @KinKhaoYangKap · Aug 31
He isn't saying that. He is essentially saying that the only RCT that has been completed showed cloth masks increased the chance of reinfections.

7

Yardley Yeadon
@MichaelYeadon3

Replying to @KinKhaoYangKap @PeterFaberSP and 2 others

Yes, that's correct. The only large RCT I'm aware of has exactly that conclusion: cloth masks give poorer outcomes than no masks. Medical mask was not better than no mask, either. It's a 2015 study in a cluster of hospitals in Vietnam.

I believe you mean well, but I'm sorry, that's just completely incorrect. Depending on how much challenge your body experienced in overcoming the virus, you might have lots of circulating antibodies, or none at all. Both have been reported recently in the literature. As far as...

2

UK Mushroom @derek_rocholl · 3h

Again if you haven't got antibodies you aren't immuneto the virus. If you aren't immune you aren't capable of contributing to herd immunity. It isn't a difficult thing to understand.

2

Yardley Yeadon @MichaelYeadon3 · 2h

You'll see from one paper I've added that your understanding of immunity, let alone herd immunity, needs some revision.

1

UK Mushroom @derek_rocholl · 4m

The paper you shared "indicate the risks of using COVID-19 'immunity passports' and support the prolongation of public health interventions, including social distancing, hygiene, isolation of high-risk groups and widespread testing".

1

Yardley Yeadon

@MichaelYeadon3

Follow

Replying to @derek_rocholl @LeahButlerSmith and 2 others

Sure, but I'm sure you can see that's the authors perspective. I shared it so you could assess the objective evidence. What one does with it is a political decision, not something I'm au fait with.

Debate with Vernon Coleman

Dear Matt Hancock

I am writing to request that you arrange a live TV debate with Dr Vernon Coleman about vaccines.

I am confident that my request is made on behalf of many people for the people.

As you are our paid employee we demand that you put into place arrangements for this to be carried out in the shortest amount of time.

I look forward to receiving the date and time of the debate taking place and will happily support you in sharing this information far and wide to ensure good audience coverage.

Regards

Nina

Evelyn @728evelyn · 1h

I think it's well worth looking at what's going on in other countries ... Spain & France for example! Hospital admissions & deaths increasing.

2 1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @728evelyn @UKCovid19Stats

Spain is cheating on Covid19 admissions. If you're admitted after a bike accident & have a mangled leg, if you then test positive after admission, bingo, you're a 'covid19 admission'.
It's a recent change. A new way to lie.

A problem emerges when we see what the number of cycles actually means

38-40 means you are picking up scant amounts of RNA or environmental contaminants

So you're going to detect any amount of SARS-CoV-2 RNA, but doctors don't know the Ct, they just see positive/negative

5

What does Ct mean?

In a real time PCR assay a positive reaction is detected by accumulation of a fluorescent signal. The Ct (cycle threshold) is defined as the number of cycles required for the fluorescent signal to cross the threshold (ie exceeds background level). Ct levels are inversely proportional to the amount of target nucleic acid in the sample (ie the lower the Ct level the greater the amount of target nucleic acid in the sample). WVDL real time assays undergo 40 cycles of amplification.

Cts ≤ 29 are strong positive reactions indicative of abundant target nucleic acid in the sample
Cts of 30-37 are positive reactions indicative of moderate amounts of target nucleic acid
Cts of 38-40 are weak reactions indicative of minimal amounts of target nucleic acid which could represent an infection state or environmental contamination.

4 23 89

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @gummibear737

I don't think those Ct values are correct. If I'm recalling him correctly, Prof Heneghan said positive over Ct 30 never gave rise to successful culture of virus from clinical samples. I do wholly agree with your reservations though, simple positive or negative.

This will not lead to a major change in the figures. The nitpicking as with the Welsh data is minor and small scale. What you do not accept is that morbidity and mortality from Covid are long term issues which exceed the arbitrary short term time scales you place on everything.

6

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @dthroat @carlheneghan and 2 others

There are in some recovering CV19 patients some long lasting deficits. We know this is also true after influenza, for example. Do you have a data of quality showing whether the post-covid morbidity is worse or less bad than after 'flu? I'm open to any answer, provided evidence.

No Mask Steve @RedsReporter · 18h

Especially as it has been proven that you will have a positive result if you even have common cold antibodies in your system! PCR does NOT test for covid-19. It can't!!

1

Yardley Yeadon @MichaelYeadon3 · 16h

With respect, that's incorrect. PCR has many weaknesses, but the primer designs chosen means it doesn't light up with other coronaviruses. At least, so we're told.
Do you have a paper or article showing it does cross react to colds?

1

No Mask Steve @RedsReporter · 11h

"However, there is a chance a positive result means that you have antibodies from an infection with a virus from the same family of viruses (called coronaviruses), such as the one that causes the common cold," - CDC statement.

1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @RedsReporter @Louise_katz

Sure, but that comment relates to testing for antibodies. Here it's definitely possible to have antibodies after a different virus. Depending on how the antibody test is designed, it might give a false positive.

Guy Smith @spotdog39 · 2h

Next they'll want to vaccinate millions of people who already have effective cell mediated immunity to produce antibodies against Cov-2 spike protein (and hence angiotensin 2). Even if there's no correlation between antibody level and severity of disease this doesn't sound smart.

Note to self: watch this again. Hindsight can be a cruel master but it's what we do with new insights that's the better & fairer year. I myself started very frightened before 1st lockdown but by its end, I opposed the extensions & pretty much everything Govt has done since.

Chris Collins @hbollinger7

Replying to @MichaelYeadon3

Even the "Independent" SAGE's expert modeller had clocked this back in May. Yet that supposedly transparent body chose to suppress that because in did not suit their agenda.

a spade is a spade (Identifies as stainless steel) @ig732 · 4h

Up to 1 in 45 tests produces a false positive. Far from ending social distancing this could cause another full lockdown.

Yardley Yeadon

@MichaelYeadon3

Follow

Replying to @ig732 @GuidoFawkes

At the moment, it's pretty much the other way around, with 90-95 of every 100 'positive' tests bringing false positives. The false positive rate is hugely greater than the actual prevalence of the virus.

While the initial ease of transmission, the R0 value, definitely matters in terms of the % susceptible remaining below which transmission effectively halts, the instantaneous infection rate, termed R, begjns to fall as the virus spreads until it's below 1.

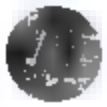
The tests are being conflated together, which test for antibodies that overlap COVID-19 & other coronaviruses.

An asymptomatic positive test result is deemed a "case" (nonsense).

This is disinformation & fraud on an unimaginable scale. Only Donald Trump can stop this. (1/2)

1 1



Tiberius Claudius @sonofdrusus · Jul 25
This fraud could hypothetically continue forever.

The "news" media, Democrat officials, & the $$ forces behind them are all complicit in this. The goal is to keep the citizens scared & the economy crushed for the election.

Can only hope Trump's strategic genius can outfox them.

1

The shape of the daily deaths vs time plot bears no signs whatsoever of human interventions. These would be evidenced by discontinuities, inflections, slope changes etc. Yet for most heavily infected countries, the plots are almost superimposable.

It is heartening to see Sweden's complete curve. It's assumed that if they'd locked down, far fewer people would have died. There's no evidence for that. They do concede that they totally failed to protect care homes (neither did many others). They're now at herd immunity. Enjoy!

Replying to @GwynCarwardine @AlistairHaimes

Why would you say it's non verifiable? We've a great deal of evidence about the distribution of SARS-COV-2 reactive T cells prior to the virus arriving. Epidemiological theory shows us in that setting, where starting susceptible proportion of population is <<100%, with a given..

I do wish people wouldn't make claims about herd immunity. It's non verifiable. What they are is out of flu season. Let's see how immune they are during winter

.. R0, what % of population must be infected before transmission cannot be sustained. At least some of the evidence is consistent with such a % indeed having been infected (based on IFR & deaths, or via seroprevalence, admittedly with Mangles Constant invoked :)

Interesting thread on the virus, agendas and complete overreactions by Govt egged on by the MSM. Much of this mania about US election. That repressive Lockdown persists with its consequences on economy, health and states of mind is quite sinister.

Replying to @tinkersong

I agree. Not only sinister but thoroughly depressing.
Even though I have a competing narrative of the pandemic which fits the evidence well & better than the tabloid version Govt is following, they have all the power while I have none at all.

We've got a near term date to present to a senior management team of the NHS.
It's a start.
I'm approaching several online media to see who'll host the position paper, which must be open access.
Might be able to use the website of a learned society. My professor pal runs it.

I can't imagine the strain of being a parent right now.

You've got your job and financial survival on the line. You're being forced back to a dangerous workplace under duress.

You know it's not safe for your kids to be back at school but you can't leave them home alone.

Hell.

Viral cultures for COVID-19 infectivity assessment. Systematic review 'strong relationship between cycle threshold value and ability to recover infectious virus and that the odds of live virus culture reduced by 33% for every one unit increase in Ct'

13 92 206

Steve #NoMasks @SteveG06322664 · 3h

For the idiots amongst us (including me). Are you saying they are magnifying the tests so much that basically anyone who has had a sniff of the virus in the last 2 months will return a positive result ?

1 2 3

Yardley Yeadon

@MichaelYeadon3

Follow

Replying to @SteveG06322664 @carlheneghan

Yes. The impression is gained that many PCR tests in the community are running up to 40 cycles. Prof Heneghan's review indicates that virtually no one positive at cycle threshold of 30 & up is carrying live virus.
Most positives are false positives so "cases" on news are bunk.

Adam Knight @APK_musicreview · 10h

For the dummy's amongst us what does this mean?

4 6

toffeepud @AbiChippindale · 8h

If you have to run CT cycles more and more, concentration of active virus is weaker and weaker and weaker. So 40 cycles cd be someone who was actively infectious with a coronavirus 3 months ago. But will be told their test is positive and self isolate now.

1 3

Adam Knight @APK_musicreview · 7h

Utter shambles then basically 🤦 the latest in a long line of shambles!

1 2

toffeepud @AbiChippindale · 7h

Yes, basically. There's no consistency across labs apparently, it's like they're determined to find people positive. CDC in USA have set the upper limit to 20 cycles I believe. They declared 95% of positive tests in 1 state to be negative, after learning this

1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @AbiChippindale @APK_musicreview @carlheneghan

CDC also recently revised guidance: they recommend that PCR should only be used in people with symptoms.
What are we doing? Mass testing the well.
Idiots.

Twitter friends, I could use your help. My two coauthors have agreed to publish our position paper from Monday.
Problem is, I have no media outlet agreed, despite making a few calls. So far, I'm not getting traction.
Any suggestions for where it can sit, open access? Pls DM me.

> **Yardley Yeadon** @MichaelYeadon3
> It's hard to recall that we *thought this. SARS-COV-2 was new, but structurally it's akin to other, endemic CoVs (229E, NL63, OC43, HKU1). Yet it was decided that:
> "Because this virus is new, *no-one has any immunity to it".

Thanks - aside from the written piece, more is needed to create an alternative view of this "continuing crisis", which in my view is now predominantly political / economic / social & much less medical.

Furthermore, as confirmed in a meta analysis by Prof Carl Heneghan recently, positives at cycle threshold >30 do not permit virus to be cultured. They're neither infected nor infectious. "Cases", defined as being PCR positive, even at high Ct values, are 95% false. Serious error.

It's important we read this. In essence, the PCR test can detect broken down pieces of 'degraded viral RNA' for up to several months after initial infection. That's assuming they ever were really infected. The assay throws out an unknown number of false positives, perhaps 1-2%.

Also, calling it “coronavirus” is thoroughly misleading. The virus of concern is called SARS-CoV-2, which is a member of the coronaviridae family, four of which, also called coronavirus, cause some of our common colds. Govt: you set a poor example with this sloppy use of words.

Fancy having a test to see if folk have a 'deadly' virus, you couldn't make it up! They are testing for coronavirus, which includes the common cold. They want to keep the fear going, the cases going, not deaths, and keep you under their control. Research and think for yourself.

True, HKU1, OC43, NL63 & 229E are also coronaviruses which are endemic & contribute to the common cold.
Those who've been exposed to some or all of these possess T-cell recognition responses to SARS-CoV-2 & were almost certainly resistant to infection, illness & transmission.

You were quite possibly immune to the "novel virus". Several studies across the world have shown 30% and even 50% had effective T cell responses, just like you would if you submit to a vaccine that you almost certainly don't need.

Thank you, we always knew there'd cut a cutoff & Prof Heneghan's meta analysis shows us that Ct >30 is negative in reality, whatever the test reports.
I'm not surprised if, with different PCR kits, a different Ct cutoff applies. Point being, characterise the assay then deploy.

...age profile of those recently tested, anywhere in U.K.? I believe the sole reason that "rates are up in the under-40s" is that these are the only, or are disproportionately those being tested. Come on, PHE: prove me wrong.

6 12 85

Yardley Yeadon @MichaelYeadon3 · 5h
So, a day later, no one can falsify this idea. They've just opened a walk in test centre at University of Kent at Canterbury. Nice substrate for testing 100s to 1000s of young people.

7 5 28

Lisa @lisa12000___ · 3h
Is this the same for the higher proportion of BAME groups testing positive? They have been stigmatised by people suggesting that they aren't abiding by rules however round here they set up walk in centres at mosques in two different areas so they're obviously being targeted

1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @lisa12000___

In this regard, I think there is something really going on, as there appears genuinely to be an elevated level of risk of severe illness & deaths in BAME groups. I've noticed there is nothing in recent reports about "cases" & BAME.

How can anyone know there will be a second wave, let alone when?
The apparent increase in “cases” in U.K. all flow from conducting very many more tests than before.

helen grimbley @helengrimbley · 17h
That makes no sense. Your graph shows deaths. Yesterday 92 people died of COVID-19, if you choose to compare with earlier in the crisis. If you want to look at cases an equivalent graph shows a clear uptick - 2,000 infected yesterday. A less deadly, but clear insurgency of virus

6 3

Where did 92 people died of (do you mean from or with Covid19?
Definitely NOT in uk, they didn't.
And as for "cases", can't you read? Prof Heneghan has just shown unequivocal evidence that positives in PCR with high cycle thresholds are not infected or infectious.

Replying to @arthistorynews @jonarnoldimages and 3 others

The authorities everywhere have greatly ramped up daily testing. So they find more "cases". That is not evidence that the virus is spreading. It's evidence they're testing more people. As to the results, "cases" identified using PCR run to more than 30 cycles are meaningless.

YiannisLoutses @DonYiannis1515 · 31m
I have a comorbidity, don't take any drugs and likely have 20-30 years ahead of me, but if I get covid-19 I'm much more likely to die than others without comorbidity. If I'm dead in 6 weeks time having contracted covid-19 are you suggesting it was the comorbidity that did me in?

1

Yardley Yeadon @MichaelYeadon3 · 3m
No, I'm not claiming anything. I'm pointing to an analysis conducted by presumably qualified medics in Sweden. If you were to be pushed over the edge & to die because of contracting Covid19, I would see that as a death from the virus. It appears most people in Sweden who died...

Yardley Yeadon @MichaelYeadon3 · Sep 1

Matt: the virus is under control. True prevalence is <0.05%. I believe even this is an overestimate.
Cease the misleading PCR with high cycle threshold. It's absolutely false to drive it to Ct 40. Anything >30 is false. There's no active infection nor are they infectious.

> **Ruminator Dan** @RuminatorDan
> Sir Edward Leigh MP (UK) making a completely reasonable and sensible point. twitter.com/EdwardLeighMP/…

7 71 174

Louise B. @louisebentley10 · 3h

Amongst other things, the fact that it can vary from country to country sets alarm bell ringing for me. How can a 'test' for the 'same worldwide virus' not be tested for to the exact the level? Screams of manipulation to me.

1 2

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @louisebentley10

I think that's fair. I don't understand why there's any flexibility on cycle thresholds in diagnostic PCR. Different if it's an analytical tool in a res. lab. But with human disease, a cutoff has always been needed. It was only recently that I learned of this variation.

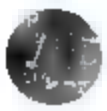
Interesting numbers when I used the death certificate audit data from two Swedish regions where C-19 was established as a direct cause of death and excluded C-19 as a minor contributing factor only. @FatEmperor

14 67 114

Michael @BelfastBatman · 4h
Didn't cdc say 93% deaths 'with' covid. And way back the Italian health minister in the review of deaths also used a very similar figure, if I recall correctly. Seems very similar in Sweden too.

2



Henrik Wallin @HenrikWallin3 · 43m
The 6% is just fake news. @MedCramVideos did an explanation:

When you get covid, you will get for example pneumonia and blood clotting, so that will also be written on the death certificate

No one dies of covid alone, so those 6% are just wrongly filled out death certificates

1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @HenrikWallin3 @BelfastBatman @MedCramVideos

If they died of viral or bacterial pneumonia secondary to covid19, that death certificate would probably say the virus was the triggering cause & secondary pneumonia the mechanism? A 'real' covid19 death. I understand your point.

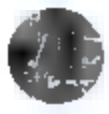
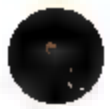
So, a day later, no one can falsify this idea. They've just opened a walk in test centre at University of Kent at Canterbury. Nice substrate for testing 100s to 1000s of young people.



7 5 30

Lisa @lisa12000___ · 15h

Is this the same for the higher proportion of BAME groups testing positive? They have been stigmatised by people suggesting that they aren't abiding by rules however round here they set up walk in centres at mosques in two different areas so they're obviously being targeted



1

Yardley Yeadon @MichaelYeadon3 · 12h

In this regard, I think there is something really going on, as there appears genuinely to be an elevated level of risk of severe illness & deaths in BAME groups. I've noticed there is nothing in recent reports about "cases" & BAME.

1

Lisa @lisa12000___ · 12h

Do we think that as well as risk of severe illness there is an increased susceptibility to them actually catching it in the first place? Just seems the spread of infections amongst BAME groups seems wider even with the same amount of contacts as non BAME groups

1

I think that is accurate because it's borne out by widespread inverse correlation between high EWD & low covid19 deaths. I don't think the novel virus is particularly remarkable & had it occurred three months earlier, it would have been within the range of occasionally large EWD.

The virus season covers autumn/winter/spring, involving Rhinoviruses then influenza then Coronaviruses. Last autumn/winter there was an exceptionally low level of the first two, so many elderly/vulnerable were spared until spring. In previous years, they'd sadly have died earlier

2 1

Markus Antonius @Siggers69 · 3h
I remember seeing a graph which showed a reducing trend for the previous 5 years, which would increase the number of vulnerable further, can't seem to find it now.

2 1

Yardley Yeadon @MichaelYeadon3 · 2h
Those countries with low excess winter deaths for last 2 winters in aggregate had the highest death rate for covid19, like Belgium & U.K. while those with high recent winter deaths saw far fewer COVID deaths, like Greece & Germany. Outcomes had NOTHING to do with Govt choices.

8 40 111

Mr King #KBF @Mr__King_ · 59m
Not questioning your source of data - but would like to know what it is so I can show to others. Thanks.

I've seen it doing the rounds here over several weeks. It definitely wasn't my idea but some enterprising soul thought it worth exploring & found a visually very appealing inverse correlation.

I think it says 49, on top of 70 odd others, so a little under 1% positive rate? It's not possible to run 17000-odd tests & get 2 positives.

hardlyperennial @hardlyperennial · 6m
It says 47 tested one week, then an increase of 300% to 17,500 tests with an increase of 2 tests to 49. The 300% increase in testing produced 2 extra tests

Are you familiar with the effect called false positives? In the case of this PCR test, an amplification test borrowed from molecule biology labs, the false positive rate is around 1%. So that mass of tests can't yield 2 positives, but must instead give around 175.

Johan, did you know that the false positive rate of the SARS-COV-2 PCR assay hasn't been determined, experts think it'd in the typical 0.8-2.3% seen with similar assays? So finding 850 or more positives could easily be FP. Alternatively, retest the positives: removes most FP.

There are a substantial number of deaths with / from the virus. Only the timing made the effect remarkable. Had it occurred in winter, we might not have noticed, other than to remark the intensity of the “influenza-like illness” & deaths are this winter.

James @JamesRiley199 · 25m
Thanks for this. Too many politicans are focused on the idea of the vaccine being the 'magic bullet' to get us back to normal life. It needs to stop.

2 11

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @JamesRiley199

You're right. It's very unlikely that efficacy will be sufficiently robust in almost everyone (together with the required, extraordinary safety profile) that vaccination will "terminate the pandemic". It's a laughable idea...unless someone is up for vaccination of the planet.

This is what's being done. Logically it's the only possible explanation. It's not plausible that the virus is selectively infecting the young. For a start, they were the least inhibited previously & were more likely than older people to have been infected months ago.

So this suggests the virulence hasn't changed but number of susceptibles (to death) is 1 or 2 orders of magnitudes lower now.

1

Willem van Schaik @WvSchaik · 3h
No, it suggests the virus is now primarily spreading among younger people who rarely develop serious disease but when it moves on to the elderly, we will see similar %deaths among that cohort as previously.

5 4

Martin @Dummokratie · 39m
how do you think a virus decides to aim for different age groups?

is there a tinder or parship for viruses?

or have we just moved from testing symptomatic elderly towards testing asymptomatic young?

5 4

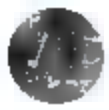
Hussain Mulla PhD @Hussain46581012 · 3h

But what find perplexing is, I find it difficult to believe we are doing such a great job of protecting the elderly (I see plenty of mixing of all generations). I can believe we are protecting the nursing homes much better now, and reduced nosocomial transmission, but still....

1 4

David Warren @AzWarren · 2h

Non medical person here, but is it possible that many of the most susceptible have already been through it and that is why the % of severe cases is decreasing?



2 2

Willem van Schaik @WvSchaik · 1h

Even in cities like Madrid where ~20% of population will have been infected in 2020 there are still large pools of susceptibles

1

Yardley Yeadon

@MichaelYeadon3

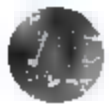
how do you think a virus decides to aim for different age groups?

Is there a tinder or parship for viruses?

1 6 11

Yardley Yeadon @MichaelYeadon3 · 46m

..that most screens are not being run because people are ill & worrying what they have. So it's people without symptoms who're getting tested. The testers can select those to invite for testing on any basis they choose, like DOB.



1 3

Gordon Hynes @dcnseven · 35m

Wouldn't it make sense to turn down the test sensitivity so that they only detect the ones who are definitely infected?
Surely finding one with a large viral load is more useful than finding a hundred who don't pose a risk.

1 1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @dcnseven

Obviously, yes. Prof Carl Heneghan has made this point repeatedly. He published last week a metaanalysis showing that 'positives' at Ct>30 aren't carrying viable virus. They're not infected, not ill, not going to get ill & crucially, mot infectious.
Why aren't they doing this?

Not wanting to criticise, as I support your letter. However I must point out you have worked 32 years funded by big and been educated by big Pharma? Every school controls independent thinking. Over the last 32 years I have seen the illness vaccines cause! You cannot beat nature!

3 7 31

Yardley Yeadon @MichaelYeadon3 · 9h
In turn, I will not criticise you. You're entitled to your views. I think long established vaccines area useful component of our health system, yet there have been mistakes. Vaccines aren't my area of expertise but the same principles of good clinical practise should apply.

3 40

ElevenEleven @Thomas_Marek_ · 6h
Either am i an expert on vaccines. But from what you have stated, i strongly suggest you at the very least, review four or five of the product monographs of the main 'mandated' vaccines. Trials range from 5-45 days and are very weak-kneed. Change my mind.

1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @Thomas_Marek_ @TheRealMilkCo @martingeddes

There is a major difference between deploying a new vaccine using new platform technologies & using a vaccine for which there is now extensive clinical experience, even if at time of launch, that too lacked much long term safety information. In my view, anyway.

Plus the obvious question of why the pharmaceutical companies are all seeking indemnity ....?!

1 1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @DiPettitt

Because they're pressured for expedited delivery of vaccines. They don't really want to launch something incompletely tested. I'm fairly sure they'll have said "we can't guarantee safety long term", & this is Govts response.

Its because a lot of westerners behave like spoilt brats who dont like being told what to do. They say there is a 99% survival rate but they dont seem to take into account the long term damage the virus can do. Maybe the brain damage effect has already got to them?

1

Yardley Yeadon @MichaelYeadon3 · 4h

I'm ahead of you on the longer term I'll effects. Reviews so far available do not support the contention that these are more prevalent or more severe than after influenza.

1 1

James @JamesRiley199 · 4h

Thanks for clarifying thing Michael. I've been thinking, as COVID although a nasty disease seems a very similar illness to influenza do you think people get a worse illness with confirmed covid because it's been drilled into their minds that it's worse than it actually is?

Yardley Yeadon

@MichaelYeadon3

Follow

Replying to @JamesRiley199 @Gandalfswand @DaisyKirsch

A kind of inverse placebo effect? I don't know.
I believe that this virus is somewhat more lethal than most influenza strains, but not worst than all such strains. However, for neither SARS-CoV-2 nor flu are we able to know exactly how many get infected yet have no symptoms.

I am inclined to trust the ONS surveys because they MUST be doing their PCR testing very differently from PHE. ONS prevalence reports are far lower than the kindliest estimate of false positive rate.
Would someone from ONS please confirm, do you retest the positives?

1 2 6

Alistair Haimes @AlistairHaimes · 34m
I think they retest positives twice?

3 3

Steve B @sgbart · 32m
Thank you to the three of you for your common sense throughout this catastrophe.

What I just don't understand is motive. Do you have any thoughts?

Replying to @na_nanav @mjknight0380

The last thorough analysis I read does indeed find a proportion of people remaining unwell after covid19 but nothing stands out as remarkably different from post influenza sequelae.
I think what's new here is that very few people knew there were post-flu morbidities in some.

There will be a small group who remain at such risk that it may make sense for them to choose to accept a vaccine which hasn't yet completed normal safety assessments.
That informed decision though must ALWAYS rest with the prospective patients, not Govt.

Yardley Yeadon @MichaelYeadon3 · 23s
SAGE testing strategy document Aug 31st.
assets.publishing.service.gov.uk/government/upl...
It includes a good description of the issues with PCR, but not solutions. Have a look at Scenario 2, p11. When virus prevalence is as low as it is, with a false positive rate where I think it is (around 1%, may...

1 1

Yardley Yeadon @MichaelYeadon3 · 22s
...be more, upwards of 99% of the positive tests are false positive. They could easily slash this FPR by re-testing positives. That's in this doc, too. But they're not doing that but, instead, running full throttle, a knowingly flawed test, creating thousands of false positives.

1

Yardley Yeadon
@MichaelYeadon3

Follow

Come on, SAGE, tell me why it isn't a wholly reasonable conclusion that the vast majority of positive PCR tests are false positives?
Have you noticed that no one seems to be ill? You're given pap about the young. In France, all ages have the same positive rate as the young.

Apart from this, how credible is it that cases should double in a week, out of nowhere (previously growing steadily at ~20% per month)?

Indeed, not credible. But I've heard they've substantially added daily testing capacity over the w/end.
They won't be able to keep this trick up for long, though.
Watch for a gear change into a different assay. That would be problematic as we'd not know if it suffers same issues.

A position paper by me, Prof Paul Kirkham & Mr Barry Thomas.
Of particular note is the claim that the SARS-COV-2 pandemic is essentially complete in U.K. Further, that it is most unlikely to return as a large, consolidated outbreak, aka 2nd wave.

18 161 274

Paul W @sideboard_billy · 41m
Thanks Mike. Interested to hear your views on the increases in positive tests (above false positives) & hospital admissions that may be beginning here and been seen in France, Spain and Italy. BTW I know these are very small, just wondered how this fits with your thoughts.

1

Yardley Yeadon
@MichaelYeadon3

Replying to @sideboard_billy

I've not seen data from France beyond what looks like a huge 'second wave' of almost certainly mostly false positives. I've not spent time on other countries stats beyond deaths data. Once you realise there's deceit going on, you regard all data as suspect unless corroborated.

I seriously don't know why we test a few days again after a positive result to rule out false positives. False positives are really driving the narrative at the moment and in the completely wrong way!

1 1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @djrsquared

Until 2020 & this virus, every country in the world who used PCR for detection ALWAYS retested positives to wash out false positives.
When virus prevalence is lower than the false positive rate, the test yields almost all false positives.
Why wasn't the global SOP followed?

Phoenix44 @Phoenix4419 · 1h
The number of deaths has dropped either because state restrictions with no evidence they work led to a decline that exactly mirrors both a classic infection curve & the curve in countries without those restrictions or they did almost nothing & the epidemic declined naturally.

Van Tam either needs to be fired for monumental incompetence (if he didn't know that overnight, a major revision to testing paradigm was issued) or for telling untruths (if he did).
He's good with analytical issues (recall his put downs of Peston?), so sadly, the latter likely.

MOST peculiar that Van Tam is bloviating about "cases". He must know that Govt has realised that the PCR test has a much higher false positive rate than the prevalence of the virus. I say this because last night, .Gov issued this edict to change the test, as we & others have...

Peter Duckworth @GrumpyPete · 3h
If they retest using the same method will they not end up with the same result?

6

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @GrumpyPete

No. If say 1% are FP, they retest ONLY those positives. If genuine, most will remain positive. If false, only 1% will be positive.

The government is to significantly reduce the threshold for lawful gatherings of people in homes from the current 30, perhaps to as low as six, I understand. This is a first response to the significant spike to circa 3000 a day in Covid-19 infections we've seen...

Replying to @Peston

Robert, there is no spike, there are 99% false positives.
Dot Gov last night issued an edict to radically change PCR, "because of excessive false positives".
If you don't even read Govt docs you're disqualified from commenting.

> You might be used to thinking of 30-somethings as safe and seniors as at risk in this pandemic. But if a man in his 30s and a man in his 60s both contract COVID-19, it is more likely that the 30-something will develop a months-long illness than that the 60-something will die, according to this research. (The calculation above doesn't even include the countless long-haulers who never went to the hospital.)

A position paper by me, Prof Paul Kirkham & Mr Barry Thomas.
Of particular note is the claim that the SARS-COV-2 pandemic is essentially complete in U.K. Further, that it is most unlikely to return as a large, consolidated outbreak, aka 2nd wave.

22 182 302

This is interesting. What is your view on increasing hospitalisations in France and Spain?

3 2

Yardley Yeadon @MichaelYeadon3 · 2h
I'm not convinced it's real, yet. There's definitely something v odd going on re PCR testing in relation to false positives.
If an area literally locked down so well that pop didn't get exposed Feb-May, we'll see the rest of 1st wave.

4 1 3

Bestbaldmanever @bestbaldmanever · 2h
Cheers. Slightly different q... My Mrs is a teacher; says that there is very little social distancing or 'bubbling' going on in school. She's got quite bad asthma so is higher risk if she gets it. How worried should she be, in your view?

2

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @bestbaldmanever

She should ask her doc of respiratory nurse (if they still exist). I've a memory that, surprisingly, asthmatics were NOT found to be at elevated risk, but seriously, ignore some fellow in a Twitter! Ask a GP.

Well, if you're naming Buttar as one of the foundations of your position on covid it's no wonder why you are so completely wrong. The man is a complete quack who was denied a medical licence for previous unethical & lethal treatment of patients with quackery medicine.

1

Trevor Chapman #KBF @trevorjc2511 · 8m
There have been loads of doctors here and all over the world who question the worlds response. Many have been silenced for going against the narrative, Buttar is just one. It's fine if you want to believe what you're being told, it just doesn't make sense if you look into it.

1

attica_attica @tica_attica · 5m
No. It does make sense of you ignore all the accompanying nonsense. Slipping on a mask is a harmless simple act to contribute to reducing whatever risk exists. It harms me in no way and may save lives of others. I've lost family, I don't want others to lose theirs.

How many patients will have been regularly examined at say 4-6 week intervals for a year after immunisation?
I suggest a year as that's common for med interventions with prolonged effect. Here we'd like to ascertain no adverse effects through a single cycle of seasonal events.

   You're right. It's very unlikely that efficacy will be sufficiently robust in almost everyone (together with the required, extraordinary safety profile) that vaccination will "terminate the pandemic". It's a laughable idea...unless someone is up for vaccination of the planet.

...be no safety database on a lot of people for a substantial period after vaccination.
This is the time to express concern if ever you're going to.
On top of this, some leading politicians have spoken of compulsory vaccination. I regard that as an illegal assault.
Good enough?

‘Accepts’. We need to account for sharp turning point, seen time & again in multiple countries. Personally, I find the aggregate measures = same downward impact, while leaving perfect, Gompertz like curves not credible. Anyway, we don’t need to persuade one another! Good luck :)

A position paper by me, Prof Paul Kirkham & Mr Barry Thomas.
Of particular note is the claim that the SARS-COV-2 pandemic is essentially complete in U.K. Further, that it is most unlikely to return as a large, consolidated outbreak, aka 2nd wave.

23 192 316

@MichaelYeadon3 so they are now saying a first positive test requires a second to confirm? Trying to decipher as a lay person here. Thanks for pointing this out

1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @CJ50268182 @Peston

Yes, but we've always done this when PCR is used in mass screening when virus prevalence is low. You have to, as the nature of the test is to yield many FP. Just retesting the positives is all that's needed, and was the WW standard until suddenly it wasn't!

Have a good read, you sceptics, and see how much faith you still have in the daily "cases" you're told about.
They're almost all false positives.

18 176 274

M477 4s @looking4ans · 7h
How will retesting help? Will they be amplifying it the same amount?

1 4

Yardley Yeadon @MichaelYeadon3 · 5h
They retest ONLY the positives. If they're all genuine, almost all will be positive on retest. If on the other hand they're mostly false positive, only a percent or so will remain positive. So it's a good filter.

3 3

Oli PARKER @OliPARKER2 · 2h
Thanks for this. Any idea when they will be publishing figures with this retest-of-positives regime in place (ie how long until the good filter is applied)?

MOST peculiar that Van Tam is bloviating about "cases". He must know that Govt has realised that the PCR test has a much higher false positive rate than the prevalence of the virus. I say this because last night, .Gov issued this edict to change the test, as we & others have...

17 186 342

Repre-Jens-ible #KBF @Jens1872 · 3h

let me just check that this is a reputable, impartial, unbiased source... oh it's "lock down sceptics"... move along

4 7

Julia Hartley-Brewer @JuliaHB1 · 2h
It's not written by them, is it?

3 3

@glimbrick · 1h
Did you read it? It's full of sentences like "The authors recognise that the exact number in this example is speculative..." and "The most susceptible were those already elderly and/or ill... Once that super-susceptible group were removed from the pool of individuals..."

1

Julia Hartley-Brewer @JuliaHB1 · 1h
Yes I did. It correlates with what many other leading experts in the field are also saying. What in particular do you think is wrong about their argument?

1 1

@glimbrick · 1h
It also contradicts what other leading experts in the field are saying. And sentences that equate deaths to acceptable losses are a little unnerving.

2

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @glimbrick @JuliaHB1

I don't recall the word "acceptable" in that section. Could you explain a little more about your reaction?

Nobody seems to be talking about how London was virus-free months ago. The area with the largest population and transport infrastructure plus 3 international airports plus a large BAME community. How does that happen?

1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @CpFulham @FraserNelson

If that's a serious question, the answer is that a sufficient proportion of London's population has been infected such that the remaining susceptible fraction is inadequate to support a growing outbreak.
I'll wager they're not running 170,000 tests per day in London suburbs.

It's true that SAEs - serious adverse events - can lead to halting a trial.

It doesn't however mean something untoward has happened as a result of the treatment under study.

Let's give the drug safety monitoring board (or equivalent) do their work.

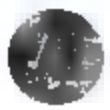
Most vaccines are in research and development for between 8-15 years. Shortest development time ever - 4 years. And you're saying they haven't been rushed? It's barely six months.

2 2

John Comfort @johnmcomfort · 14m

You really need to do your research into this. This is different. Different virus, different mechanism, different everything. We got really, really lucky that #covid19 is a close cousin to viruses that have been extensively researched already. 1/



1

John Comfort @johnmcomfort · 13m

The way these vaccines work is completely different from things like HIV, HPV, Measles, Polio, etc. We already had a lot of this knowledge that we ported over to this particular virus. Take it or leave it, I really don't care, but we shouldn't compare apples to oranges here.

1

Yardley Yeadon
@MichaelYeadon3

inform whether someone has been infected with #SARSCoV2. Though, it is becoming apparent that not everyone infected mounts detectable levels of antibodies.
(4/13)

4 71 559

Prof Francois Balloux @BallouxFrancois · Jun 30
Antibody levels to #SARSCoV2 also wane fairly fast, in line with other coronaviruses. As such, antibody tests can fail to detect prior infection in particular for asymptomatic or mild infections. Serological surveys may underestimate the proportion of people infected.
(5/13)

10 109 647

Prof Francois Balloux @BallouxFrancois · Jun 30
T-cell-mediated immunity against #SARSCoV2 has received little attention until recently. The main reasons are that T-cell response is less straightforward to measure and it is generally considered less important for vaccine efficacy.
(6/13)

4 73 557

Yardley Yeadon
@MichaelYeadon3

There are four known coronaviruses (229E, NL63, OC43, and HKU1) that cause 15-30% of "common colds". They circulate primarily in young children. Most people get infected with one or more of these viruses at some point in their lives.
(9/13)

6 114 620

Prof Francois Balloux @BallouxFrancois · Jun 30
In contrast to antibody-mediated immunity, T-cell response is extremely long-lived. For example, people infected in 2003 with SARS-1 still mount an immune response to #SARSCoV2 17 years later.
(10/13)

12 169 807

Prof Francois Balloux @BallouxFrancois · Jun 30
While there is still no established case of #SARSCoV2 reinfection to date, it is likely those will be observed soon due to fairly fast waning antibodies. Though, anyone with a prior exposure to #SARSCoV2 is expected to experience far less severe symptoms upon reinfection.
(11/13)

21 163 792

Vahid Shahrezaei @VShahrezaei · Jun 30
Do we expected reinfected cases that might emerge soon be transmitting the disease at a much lower rate?

1 1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @VShahrezaei @BallouxFrancois

I doubt they'll transmit at all, nor expect them to become ill, because they will recognise & act swiftly via T-cells.

I don't think the model code is relevant. The assumption of 100% initial susceptibility is wildly wrong & unreasonable not, at very least, to have performed a sensitivity analysis at the time, refined as T-cell data consolidated. Also, assumptions on IFR bloated the forecasts.

Robert, it might of course, were it not for the inconvenient fact that most of the PCR positives are false positives.
HMG recognises this & last night issued an edict that all positives will be re-tested.
Let's find out whether few, some or almost all are real or false.

Prof Francois Balloux @BallouxFrancois · Jun 30
There are four known coronaviruses (229E, NL63, OC43, and HKU1) that cause 15-30% of "common colds". They circulate primarily in young children. Most people get infected with one or more of these viruses at some point in their lives.
(9/13)

6 114 621

Prof Francois Balloux @BallouxFrancois · Jun 30
In contrast to antibody-mediated immunity, T-cell response is extremely long-lived. For example, people infected in 2003 with SARS-1 still mount an immune response to #SARSCoV2 17 years later.
(10/13)

12 169 806

Prof Francois Balloux @BallouxFrancois · Jun 30
While there is still no established case of #SARSCoV2 reinfection to date, it is likely those will be observed soon due to fairly fast waning antibodies. Though, anyone with a prior exposure to #SARSCoV2 is expected to experience far less severe symptoms upon reinfection.
(11/13)

21 163 793

The fact is that all trials involving a new medical entity being tested n a lot of people, especially if some of those people are elderly / vulnerable, is that you will get deaths on treatment. That doesn't mean the treatment was responsible. Say there's been a death, maybe two.

There'll be a detailed assessment of what has happened. Physicians have to determine if there's plausibility of causation or not. If not, that's probably it. If plausibility is there, they'll look at all the details & determine whether suspected causation exists. Far from easy.

As I understand it, this is a standard method PCR. Internal Govt scientists pointed out that the false positive rate hadn't been formally determined, but they showed the results from many prior cases. The lowest FPR was 0.8%. I argue it's a stretch to claim it's not 0.8% or more.

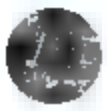
Simon the Penguin - Just going with the floe @darkfarces · 10h
Why are so few people dying of Covid now? My guess is carelessness.



It is a killer virus but by not being 100% paranoid we have been picking up small traces of the virus on our hands, through our masks etc., and gradually we built up some resistance reducing the lethal effect.

14 14 61

Angel @Amanita_virosa1 · 9h
Because its mainly young, fit people getting it and it hardly affects them. They act as hosts for the virus to increase and then they spread it to more people. Elderly and people with medical conditions that make them vulnerable are taking great care not to get it

1 2

Yardley Yeadon
@MichaelYeadon3

Yardley Yeadon @MichaelYeadon3 · 2h
It's true that SAEs - serious adverse events - can lead to halting a trial.

It doesn't however mean something untoward has happened as a result of the treatment under study.

Let's give the drug safety monitoring board (or equivalent) do their work.

7 4 30

Wendy Sharpe @WendySh55289590 · 2h
What work is that exactly? Basically ignoring adverse events and carrying on regardless even when this includes deaths and serious injury. And this is fact

3 2

Yardley Yeadon @MichaelYeadon3 · 46m
The fact is that all trials involving a new medical entity being tested n a lot of people, especially if some of those people are elderly / vulnerable, is that you will get deaths on treatment. That doesn't mean the treatment was responsible. Say there's been a death, maybe two.

2 1 2

Kate @Asilverlining20 · 41m
But if you died within 28 days of a positive COVID test, it was definitely COVID that killed you. Interesting how that works.

Robert, it might of course, were it not for the inconvenient fact that most of the PCR positives are false positives.
HMG recognises this & last night issued an edict that all positives will be re-tested.
Let's find out whether few, some or almost all are real or false.

5 11 28

Steve mab Cymru @freewelshspirit · 1h

Mike you understand the science and you know this is leading to unjustified use of an unlicensed vaccine. AZ CEO announced on Andrew Marr show that trials were being done in Brazil because not enough infection in UK/EU to prove efficacy. This epidemic was over months ago. Steve

Why give the CV-19 vaccine to newborns when they're not under the age group at risk?

> My hope is that the vaccine we have 18 months from now is as close to "perfect" as possible. Even if it isn't, we will continue working to improve it. After that happens, I suspect the COVID-19 vaccine will become part of the routine newborn immunization schedule.
>
> Once we have a vaccine, though, we still have huge problems to solve. That's because...
>
> **We need to manufacture and distribute at least 7 billion doses of the vaccine.**
>
> In order to stop the pandemic, we need to make the vaccine available to almost every person on the planet. We've never delivered something to every corner of the world before. And, as I mentioned earlier, vaccines are particularly difficult to make and store.

If true, and I think you're right, it's all rather sad.

I can envisage a load of well intentioned but utterly helpless SAGE-ites, manacled & gagged in the back of Hancock's van, careering down the mountain towards testing Nirvana.

That's fine, but is completely different from the impression we're given, that most daily testing in community is in the willing coming forward, as they have symptoms (that was reinforced by Hancock on BBCR4 this morning...that you're not eligible for a test if not symptomatic).

Could someone explain if this virus is going to be a problem forever as they seem to suggest what happened to Spanish flu, Mers, SARS and the Hong Kong flu? Why is this one different? They've either gone or are no longer a major threat

It will prompt sufficient reduction in susceptible population that R falls permanently below 1. It's just a matter of time. Our leaders have lost all perspective. It's a stable virus so this helps.

Well, would you be believe it, BBC reporting: Tests 'could be picking up dead virus' & leading to an overestimate of actual cases-which then lead to unnecessary lockdowns. Some of us have been saying this for weeks. Yet govt & 'opposition' want more tests!

This is the best quality evidence anywhere, examining whether masks vs face coverings reduces respiratory virus transmission. The answer is clear. NO, they don't. Worse, face cloths INCREASE lung infections by 2-fold & is lab confirmed.

9 September 2020

Dear

REQUEST UNDER THE FREEDOM OF INFORMATION (SCOTLAND) ACT 2002 (FOISA)

Thank you for your request dated 9 July 2020 under the Freedom of Information (Scotland) Act 2002 (FOISA).

Your request

You asked for the following :

- The evidence to support the wearing of face coverings, including data on the effectiveness of such measures.
- The scientific studies on the risk of wearing face coverings.

As I said in July, Sweden didn't implement a lock down. They opted for business as usual & kept everything open.

Look at them now. Shining. Maskless. No rise in cases. Happy people. Smiles on their visible faces as they go about their daily routines Covid19 free. It's beautiful.

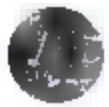
Nikki Taylor --No Mask! @BrennansPrayRug · 1h
Thank you! Can I ask, have we ever counted other asymptomatic (but perhaps, infected) people as "cases" of a disease? IFR is different than CFR, due to also counting mild and asymptomatics, correct?

1

James @JMZ_UK · 1h
Scientifically, we can only confirm a case with a positive test.

1 1



Nikki Taylor --No Mask! @BrennansPrayRug · 21m
Yes, but that doesn't mean everyone with a positive test is a case. That why Infection Fatality Rate (IFR) is always greater than Case Fatality Rate (CFR). Usually MUCH greater.

Counting all positive tests as "cases" is not just wrong, it's insanely idiotic. It's why cases...

1 1

Nikki Taylor --No Mask! @BrennansPrayRug · 19m
It's why cases can skyrocket, but not deaths. They're not actually "cases." They are infections, current or old. And largely asymptomatic. Harmless.

Yes, quite. All cases are infections but not all infections are cases.

For some reason this distinction has been abandoned.

Interesting item on BBCR4 More or Less today (Sep 9). Tim Harford had a guest, Jo Casserly, to interpret recent daily SARS-COV-2 testing data.
1. She mentioned that some of the testing was being done door to door in people without symptoms. I thought only those w symptoms or...

18 68 123

Miss Penny Longatocking Very Tory & Very Brexity @pennylongs... · 12h

Yes in local lockdown areas there are teams doing swabs on whole streets. Almost whole towns get covered, if you stay home during the day.

3 2 6

Yardley Yeadon @MichaelYeadon3 · 12h

That's fine, but is completely different from the impression we're given, that most daily testing in community is in the willing coming forward, as they have symptoms (that was reinforced by Hancock on BBCR4 this morning...that you're not eligible for a test if not symptomatic).

This is the best quality evidence anywhere, examining whether masks vs face coverings reduces respiratory virus transmission. The answer is clear. NO, they don't. Worse, face cloths INCREASE lung infections by 2-fold & is lab confirmed.

mr eyeguy @eyeguy_one · 8m
Yep. This is about transmission from someone who is infected to others. If you are infected, the mask reduces the risk of you passing it on. Hence when you have surgery, surgeons wear masks. Not rocket science is it.

2

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @eyeguy_one @ryantrading9

Surgeons mostly no longer wear masks in theatre, it having been shown that they don't reduce the frequency of surgical wound infection. You didn't know that, did you? Its funny that peoples reasons for believing one untruth is based on their misunderstanding another untruth.

Donald J. Trump **parody** @niceDonaldTr... · 1h

All this study does is compare cloth masks to N95 masks. No surprise, but cloth masks are worse than N95 masks. That's all it says. It does not say a mask is better than no mask.

2 3

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @niceDonaldTrump @allisonpearson

It does indeed show even that medical masks were not superior to the practise which most closely approximated 'no mask'. But this debate is pointless. There's no question they don't work, but those who've been gulled wouldn't accept any level of evidence to the contrary. Be well

Primary school aged children are such poor transmitters that the more of them in a notional crowd, the slower the transmission.
I'm not going to try to persuade you that masks don't reduce transmission, but they don't.
You're entitled to your own opinion but not your own facts.

There is no necessity to do this at all. There is nothing remarkable about this virus. Yes, it's probably of a lethality equal to the more severe influenza seasons. No more than that. Like it or not, herd immunity will be reached if not already. Patience, not loot, is the way.

Carole Cadwalladr @carolecadwalla
This remember is a proposal from a team that after months has still failed to deliver a functioning 'test & trace' system. That too has Deloitte at its heart. And it doesn't work. But still. Chuck another £100 billion at it.

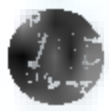
..not alone in believing that while it's fine for HMG to use Ferguson / Imperial to model the pandemic, it's unforgivable to have ONLY used this one source. There are no other voices making key predictions. His track record is a series of huge misses & always over estimates.

4 13 81



Christian Duncan @craniosurgeon · 2h

Yep. Agree on all points. NF predictions look more like 'back of a fag packet maths' than model derived e.g the 500k deaths.

How's this for a theory? C19 creased through the popn last winter and killed the most susceptible. What we have now is endemicity and mild 2nd infections

...has the immunological/ flow cytometric lab equipment & as well a belief that in outline, my proposition could be done? Seriously, why not?
It involves a lot more real data & far less modelling. I'm stunned at the spends which exclude a large study like this.
Come on, SAGE!

1 2 12

[Not] Gregarious @lfcgregarious · 57m
Especially given the vast immunity which is apparently being demonstrated in Africa.

Leading scientists on that continent are now saying that pre-immunity is the most likely situation there.

So we don't even check if that's the case here before we spunk £100B?

1 1

Yardley Yeadon

There is no necessity to do this at all. There is nothing remarkable about this virus. Yes, it's probably of a lethality equal to the more severe influenza seasons. No more than that. Like it or not, herd immunity will be reached if not already. Patience, not loot, is the way.

Carole Cadwalladr @carolecadwalla

This remember is a proposal from a team that after months has still failed to deliver a functioning 'test & trace' system. That too has Deloitte at its heart. And it doesn't work. But still. Chuck another £100 billion at it.

Can this be investigated!!

Speakthetruth111, Sinking ship of England , United Kingdom, 30 minutes ago

I work in a lab processing the results, the reason for the spike was given to the government in a statement from the Association for Clinical Biochemistry and Laboratory Medicine stating that the results do NOT show a rise in infections, but that due to the backlog of tests, it meant that we was processing 4/5 days worth in a day, causing the daily results to appear grossly different to the previous days. I have absolutely no idea why the government are dismissing this, I was completely all for this government but to see this happen, has absolutely flabbergasted me!

Exactly. And I think it's not wholly coincidence that Prof Henequen & later, lots of us, pointing out the emperor's testing clothes are well dodgy.

From March to now I've never ever believed in 2nd wave, my belief was there before proof. Once I found Sars 1 didn't have one I thought why would Sars 2. Now you say Mers also. I don't know why they always reference 100 year old flu as a 2nd wave proof when they say it's not flu!

1 6

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @NewMumOnline

Thank you, Liska. May I point out that, even with the so-called Spanish 'flu, it's not clear even there that there were multiple waves? The evidence is just as strong that there were a series of first waves with a close sequence of DIFFERENT viruses. That's an awful precedent.

I think the FPR is >0.5%. It's pretty much indefensible to claim it's lower than 0.8%, that being the smallest seen in related assays used on scale like this. The lab FPR is not likely to apply. That's why determining the FPR by spiking samples is key. Never got done. Awful.

I think 1 clue is at what level the % +ve flat-lines. With low figures noise is more significant. E.g.: using a new batch of kits or procedural change that gave 3 FP's in a large number of tests where the previous batch only gave 2 could push R up to 1.5.

Ruminator Dan @RuminatorDan

E.g. below. % +ve's declines; then settles at a low but non zero level. If R is determined by the changes in this number (slope of graph) it would be <1 during decline, then rise & settle around 1 but with significant variati...

If prevalence was low enough that most positives were false, cases would appear to stop falling & settle at a low level (+noise). R would rise from below 1 to around 1 & jump around at that level. Indefinitely. If false positives were not accounted for, R could never approach 0.

Replying to @mlilleker @driverjess @RuminatorDan

They claim not to know the FPR, neither in perfect lab conditions nor operationally. But comparison of previous similar assays showed 0.8-2.4%. If it's anywhere close to 0.8%, given prevalence is said to be 0.05%, can anyone estimate.% false positives? Thanks!

Prof CH quotes false positive (out of the real negatives) will remain even with NO VIRUS, Asymptotic False Positive Hell

2 2

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @driverjess @RuminatorDan

ONS noted that if the virus wasn't circulating, even 0.1% FPR would mean all positives would be false, & the expected no of false positives would be "approximately the number of positives we've been reporting". Q: does anyone know how we are CERTAIN virus IS circulating?

3:03 PM - 10 Sep 2020

1

Ruminator Dan @RuminatorDan · 2m
Replying to @MichaelYeadon3 @driverjess
The virus will appear never to disappear. R will jump around above and below 1, with the above 1 figures looking more dramatic if u don't understand the maths, e.g. with no real infections a doubling of FP's would take R to 2 whereas a halving take it only to 0.5.

completely all for this government but to see this happen, has absolutely flabbergasted me!

New 39 2

38 492 564

Phoenix44 @Phoenix4419 · 8h
The increase does not show an increase in infections anyway. ONS says ~25,000 total infections. Identifying 1,000 one day & 3,000 the next does not mean the total has changed. In fact the total could have dropped.

1 1

Thomas John @7thGalaxy2 · 8h
Has ONS released it's latest pop. survey?

The total count of deaths within 28 days of a first positive test now sits at 41,608.

18 43 103

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @UKCovid19Stats

You'd expect the number of deaths >28d of a positive test to be large, because in my estimation, 25% have been infected & most survived. Usually, 1500 person die per day. Not surprised if 10% of those had at some time been tested positive. Natural causes, not to do with virus.

These aren't "false positives". That term has a specific and different meaning. Are they positives upon which you can/can't call a person still infectious? That can & should be determined & a solution found but not possible from arbitrary Cts of >20. Nuh-uh.

1 1 7

L. Bettle @LaurenceBettle · 13m
You are right, I should have said that over-amplification by too many CTs may lead to observation of viral traces in subjects which are no longer infectious. Real question then is at which # of CTs do we consider that a + result is associated with non-infectious individual.

1 1 5

Yardley Yeadon
@MichaelYeadon3

Replying to @LaurenceBettle @MackayIM and 4 others

In U.K. we know the answer. Heneghan just published this correlation between ability to culture virus from sample & Ct. Over 25 almost none culture, 30 absolute tops. He & I agree we should classify positives as Ct>30 & Ct<30.

My understanding of this is 1. The test is too sensitive and non specific. 2. If a person has no symptoms he/she is not sick.

2 2

IAN M. MACKAY, PHD @MackayIM · 21m
1a. It is as sensitive as it is. Its results need 2b considered contextually
1b. It's not non-specific. That's just plain wrong.
2. But may still be transmitting. And was definitely infectious *at some point*.
Importnt to trace contacts unless your jurisdiction isn't doing that.

2

matter. Glad to hear your views.

2 1

Joseph Hicks @jrhicksesq · 29m

He was using your article to argue that COVID is not as dangerous as portrayed in the US. My understanding of is that you've found a high number of false positives and/or positives among those with a low viral load. Looks like good work, but it doesn't support his argument.

1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @jrhicksesq @LaurenceBettle and 6 others

I've not heard anyone making a lethality argument about Ct. that's clearly silly. But we're so keen not to miss a 'case' that there's clearly a tendency to keep cycling until there's a result of Ct40 id reached. Evidence shows not infectious if 'positive' but Ct>30.

Yardley Yeadon @MichaelYeadon3 · 6h

I'll be challenging SAGE, Hancock & Whitty on talkRadio tomorrow at 8.30am with Julia Hartley-Brewer to cite the literature that underwrites their 2nd wave prediction.
They've got the NHS on a low ebb, BECAUSE of this 2nd wave. That's going to cost lives: yours, or your relative.

> **Yardley Yeadon** @MichaelYeadon3
> Replying to @geraij73
> Quite. MERS also. Did it have 2 waves. No, it didn't. There was a wave in Saudi then months later, a wave in South Korea. So the last 2 novel coronaviruses, no second wave: SARS & MERS.
> Come on, you clever SAGE members. Let's have the principle & lit citation

89 310 763

Mr L Jones @MrLJones2 · 5h

The second wave prediction HAS to come from the keyboard of that discredited bedroom programmer Neil "come-around-for-a-shag" Ferguson. If he had spent more time learning to program and less time shagging married women we wouldn't be in this mess.

1 5

Yardley Yeadon

Liska @NewMumOnline · 6h
From March to now I've never ever believed in 2nd wave, my belief was there before proof. Once I found Sars 1 didn't have one I thought why would Sars 2. Now you say Mers also. I don't know why they always reference 100 year old flu as a 2nd wave proof when they say it's not flu!

1 1 14

Yardley Yeadon @MichaelYeadon3 · 6h
Thank you, Liska. May I point out that, even with the so-called Spanish 'flu, it's not clear even there that there were multiple waves? The evidence is just as strong that there were a series of first waves with a close sequence of DIFFERENT viruses. That's an awful precedent.

2 2 19

Liska @NewMumOnline · 6h
well then it's disgusting how much it's been referenced since March. I think the 2nd wave theory is to create a mind control fear tool to hold over us for compliance reasons and to encourage the uptake of the vaccine - that's my personal view there I've said it

1 4

Matthew Evans @mjamesevans · 5h
It was also coupled with a unique situation caused by the end of the war and the injured returning home.

He's not wrong and I admire his being transparent about it. PCR is a fantastic technique, in its place. It's really not suited to contaminated mass testing outside. A minor contamination with fragments of old virus, even from a sample taker, and that's wrecked the assays.

And lots of people have had operations postponed or cancelled & died as a result of a flawed test. Lancet or BMJ had example in a doctors surgery & 100% of positives were false & negative on retest, every one of them. This is rarely done, but if it was, I think we'd see the same.

Ask them where the testing data has gone.

Cases can be made to go up or down based on how many tests are done and how you approach testing. Also they should publish it at the same level of granularity as the cases data including local regions.

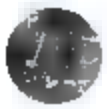
12 15 77



Zugzwang @zugzwang2007 · 11h
And we should wait to see what the positive rate actually is currently, when we know how many tests have been done since 2nd September - now over a week ago p where the weekly Test and Trace stats stop. The latest doubling in daily reported cases is since then.

1

Zugzwang @zugzwang2007 · 11h
But, in the week ended 2nd September, in old money (ie positives divided by tests) the positive rate was up from 0.66% to 0.82%. Not a frightening number in itself, but quite a leap for one week. However, that was over a week ago.

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @zugzwang2007

It's not likely that general virus prevalence has changed, though if the hotspots idea is real, it certainly could change in one locale.

positives, because earlier this week...

> **Yardley Yeadon** @MichaelYeadon3
> I'll be challenging SAGE, Hancock & Whitty on talkRadio tomorrow at 8.30am with Julia Hartley-Brewer to cite the literature that underwrites their 2nd wave prediction.
> They've got the NHS on a low ebb, BECAUSE of this 2nd wave. That's

11 75 151

Yardley Yeadon @MichaelYeadon3 · 12h
...they've ordered a major revision to the test protocol, where weak positives are to be retested. That was the global SOP until they abandoned the quality step. They should WAIT to see what that does to the positive rate. I think it'll fall markedly. Rule of good science, Boris.

12 15 77

John Smith @JohnSmi50968113 · 11h
Do you think they are actually going to implement the new protocol? BJ knows it will undermine his strategy. Far better they SAY they've changed then spin the lack of change to pretend the real rate has risen.
After all we know Boris is a lying twat.

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @JohnSmi50968113

A friend says the new restrictions will be used to explain the discontinuity (fall) in positives, once the new SOP is in place. Ferguson seemed, to me, over confident about which week would see "cases" fall.

Yardley Yeadon @MichaelYeadon3 · 12h

The reason for all the feverish swab PCR testing is to try to find the 2nd wave, and they're going door to door in selected towns, not requiring symptoms as Hancock misleadingly told you. They know these results are choc full of fakes positives, because earlier this week...

> **Yardley Yeadon** @MichaelYeadon3
> I'll be challenging SAGE, Hancock & Whitty on talkRadio tomorrow at 8.30am with Julia Hartley-Brewer to cite the literature that underwrites their 2nd wave prediction.

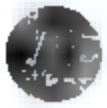
11 75 151



Carla Spade #KBF #ShowYourSmile @CarlaSpade · 12h

Saying don't get a test unless you have symptoms is gaslighting. They're PRETENDING there aren't enough tests.

It's to make the public think all the positives have symptoms.

Most people don't realise they've been going door to door testing well people for weeks.

Trite question. It's for those putting faith in absent or poor science & damaging peoples health & economy to justify the basis of their belief that, ON THIS OCCASION, we're going to experience a MAJOR "2nd wave".
No science suggests this, none at all.

I'm fine with us looking at another country to help guide us, BUT we should not rely only on ONE country. Spain had a very extended set of restrictions & it's possible they've prevented creation of much population immunity during summertime, when many infections were harmless.

Can't prove a negative, you know that!

1 1

Arthur Foxache @OldMackIsBack · 12m
It's not a negative. It's a positive that either herd Immunity or some other mechanism rules out a second wave.

FWIW I don't think we'll see a major second wave for a number of reasons, including behaviour changes, but that's just an opinion.

1 2

Arthur Foxache @OldMackIsBack · 10m
I also agree with a lot of what Michael says about testing. It does need to be improved.

Thank you. Even Govt knows testing must be radically refined, specifically to RE-TEST ALL WEAK POSITIVES.

Personally, given the importance of this & the relatively low numbers, they should RE-TEST ALL POSITIVES for a few weeks, until we have justified confidence in the data.

Consistency is important, so if we're to lean on evidence from other countries, use more than one country, and be careful to examine the data as hard as we examine our end. This is not a trivial matter, but one of life & death.

Brilliant interview on @JuliaHB1 @talkRADIO this morning. Look forward to the next one. Re:PCR - surely the Ct should be fixed to detect a certain level of infectivity. From the outside it looks as if the method has not been standardised or validated. Doing more harm than good

Thanks you & yes, I'm appalled to find there isn't a carefully calibrated cutoff. They may be finding a great deal of false positives or only a few. That we're not told this distinction is deeply worrying. Why not publish the daily data?
And, until the revised test is done,

There is no necessity to do this at all. There is nothing remarkable about this virus. Yes, it's probably of a lethality equal to the more severe influenza seasons. No more than that. Like it or not, herd immunity will be reached if not already. Patience, not loot, is the way.

> **Carole Cadwalladr** @carolecadwalla
> This remember is a proposal from a team that after months has still failed to deliver a functioning 'test & trace' system. That too has Deloitte at its heart. And it doesn't work. But still. Chuck another £100 billion at it.

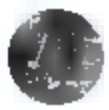
OK, but how far did the numerous one which no longer... cease to affect us because of mutations in the virus, rather than herd immunity? We have developed resistance to some viruses, but usually at a punitive cost in lives.



1

Yardley Yeadon @MichaelYeadon3 · 4m

I don't think it's due to mutation to benign forms that has enabled us to live in equilibrium with HKU1, OC43 etc, though we might not know enough about the evolutionary history of ancestor viruses. Perhaps that is what happened with those alpha & bets CoVs. However we got here..

It's important to recognise that R0 was valid only at commencement of the infection. Thereafter, Re (effective) has use, falling as % remaining susceptible fell. I'm not sure it's a valid parameter starting from where we are. Just call it growth in apparent 'cases'.

I'm fine with us looking at another country to help guide us, BUT we should not rely only on ONE country. Spain had a very extended set of restrictions & it's possible they've prevented creation of much population immunity during summertime, when many infections were harmless.

4 2 20

Yardley Yeadon @MichaelYeadon3 · 17h
So let's also view eg. France as a comparator.
Yesterday, a senior advisor to the French Govt said "around 90% of our positive test results are likely to be false positives".
Overnight, a Scottish Govt official declared the PCR test "a bit rubbish".

9 32 48

Liz Cole #UsforThem @thatsmanderley · 17h
Over 90%?! That blows my mind.

1 4

Dr P Buddy @DiscePuer · 16h
I reckon it's a lot more than 90%. It's widely held that the test produces 2% false positives. With a prevalence of about 0.05% (which it is), you'll get 40 false for every 1 true, ie., 98% of positive tests are false.

3 5 11

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @DiscePuer @thatsmanderley and 2 others

We are not being told what the false positive rate is. They say they don't know it. Itself, that's a truly dreadful admission.
My own hunch is it's 0.8%, but we don't know.

I'm fine with us looking at another country to help guide us, BUT we should not rely only on ONE country. Spain had a very extended set of restrictions & it's possible they've prevented creation of much population immunity during summertime, when many infections were harmless.

4 2 20

Yardley Yeadon @MichaelYeadon3 · 17h

So let's also view eg. France as a comparator.
Yesterday, a senior advisor to the French Govt said "around 90% of our positive test results are likely to be false positives".
Overnight, a Scottish Govt official declared the PCR test "a bit rubbish".

9 32 48

Ryan @1nationtory · 16h

Really, 90%. Genuinly can't believe that.

Yardley Yeadon

The reason for all the feverish swab PCR testing is to try to find the 2nd wave, and they're going door to door in selected towns, not requiring symptoms as Hancock misleadingly told you. They know these results are choc full of fakes positives, because earlier this week...

> **Yardley Yeadon** @MichaelYeadon3
> I'll be challenging SAGE, Hancock & Whitty on talkRadio tomorrow at 8.30am with Julia Hartley-Brewer to cite the literature that underwrites their 2nd wave prediction.
> They've got the NHS on a low ebb, BECAUSE of this 2nd wave. That's

11 103 199

Yardley Yeadon @MichaelYeadon3 · Sep 10
...they've ordered a major revision to the test protocol, where weak positives are to be retested. That was the global SOP until they abandoned the quality step. They should WAIT to see what that does to the positive rate. I think it'll fall markedly. Rule of good science, Boris.

14 20 89

Zugzwang @zugzwang2007 · Sep 10
Even before they announced the revised protocol, the number of tests in Pillar1 and 2 per case had been rising. IN the latest week reported (up to 2nd September) it was up from 2.5 tests per case to 2.73. So they were already trying to limit false positives. Cold positives, not.

Why ignore the ONS data? Random testing suggests that infections have been stable since July & that there are significantly more than this testing was finding. That suggests changes in positive tests are being driven by changes in other variables, not increasing infections.

8

Yardley Yeadon
@MichaelYeadon3

Willow Wise ✚ #UniteForFreedom @WillowWyse · 17h

I wanted to ask you too, the mythos of the existence of asymptomatic infected .. couldn't that have arisen from cold positives? Which is presumably why they aren't driving transmissions!

3

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @WillowWyse

The latest I read was that you're highly infectious from the day before you develop symptoms for perhaps 8 days afterwards. I struggle with asymptomatic transmission. To infect efficiently you need to have cultivated much virus. But in that case, you'll have symptoms.

...that numbers of "cases" & numbers of "covid19 deaths" are almost meaningless & certainly an unreliable guide to the impact of SARS-COV-2 on public health.
Do you know if there's a route to get UK criteria tightened up?
Do we know what the Nordics use as case definitions?

Personally I sure that it does, but I'm now very sceptical the case definitions are so slack that I no longer believe what I'm told by Govt. As a law-abiding 60yo, that's a lamentable state of affairs.
WTH is going on??

Littlejems @Littlejems3 · 11h
It struck me as odd why details of symptoms weren't recorded with a test. Theoretically someone could have 2 diseases at the same time, test positive for Covid but be asymptomatic for that and symptomatic with a different one? But the positive test trumps everything.

Worse: they can die of flu yet be a suspected "covid19 case". Signs & symptoms match covid19? Check. Inconclusive PCR for SARS-COV-2? Check. Suspected case, suspected covid19 death.
Does anyone know for SURE whether a person can be clinically unwell with 2 viruses simultaneously?

Nisreen Booya @nisreen_booya · 9h
Is the CEBM undertaking any study of Long Covid ?
Many such sufferers may not have been Covid by such definitions, yet months on continue to suffer. Medicine including that of EBM is to reduce suffering

2

LMcC @ElmtreeMc · 2h
Long covid is another scare tactic: a somber name added to the post viral syndrome that isn't uncommon at all and can come after *any* virus. People can suffer for months after flu. After strep throat. After chickenpox, even. This cannot be used another stick to beat us with.

So, I'm not going to be persuaded that there's truly a 2nd wave, even if it's declared, because of slack & inadequately rigorous definitions.

OTOH, if it happens widely across Europe, including in Sweden, then it would be undeniable.

Thankfully we've Sweden as negative control.

... of specific protocols for Real Time PCR of SARS-CoV-2 in the designated regional reference laboratories or is positive to a pan-coronavirus test.

If I'm understanding this, given a "suspected case" is someone with non-specific symptoms OR someone in a track/trace program.

3:47 AM - 12 Sep 2020

1

Yardley Yeadon @MichaelYeadon3 · 23s

That "suspected" becomes "probable" if PCR positive in a PAN-CORONAVIRUS test. 4 CoVs (HKU1, OC43, NL63, 229E) cause 30% of common colds. A pan-CoV PCR test will light up if the individual has a cold from 1 of these viruses.

... of specific protocols for Real Time PCR of SARS-CoV-2 in the designated regional reference laboratories or is positive to a pan-coronavirus test.

If I'm understanding this, given a "suspected case" is someone with non-specific symptoms OR someone in a track/trace program.

1

Yardley Yeadon
@MichaelYeadon3

Follow

That "suspected" becomes "probable" if PCR positive in a PAN-CORONAVIRUS test. 4 CoVs (HKU1, OC43, NL63, 229E) cause 30% of common colds. A pan-CoV PCR test will light up if the individual has a cold from 1 of these viruses.
Retweet if this is nuts.
Reply if I'm wrong.

He's not wrong and I admire his being transparent about it. PCR is a fantastic technique, in its place. It's really not suited to contaminated mass testing outside. A minor contamination with fragments of old virus, even from a sample taker, and that's wrecked the assays.

Perhaps, but then he wouldn't simultaneously be able to say (at apparently low to very low viral load) it was evidence of clinically relevant infection & infectiousness. Both the latter are implied by the word "case" yet, as Prof Heneghan shows, they have defined NO thresholds.

If an old person dies of COVID-19, either as the primary cause or the infection pushes him through the red line ("with"), PCR cycle for positive is much lower than 35. Running up to 45 or 50 cycles doesn't mean the Ct is set to 45 or 50, or that positivity occurs at 45.

Well, a PCR positive doesn't tell much about infectiousness, especially not in the 25-34 cycle zone. Below 25 it's likely that the person is infectious, while above 34 it's unlikely. The test could be repeated after e.g. 48 hours to observe trajectory & to set isolation days.

1 1

Yardley Yeadon @MichaelYeadon3 · 2m
Yes, I think you're right. Surely it would be technically possible to capture the cycle number along with the test results. The person to interact with here is @carlheneghan if Oxford's Centre for Evidence Based Medicine.
You've hit the nail on the head: <25, yes. >35, no.

@carlheneghan

Prof H, nice to see you're in good company with your review thoughts on relationships of Ct to symptoms & infectiousness, as well as the simple, powerful idea of two tests to compare Ct if positive & trajectory.

Gabor Erdosi @gerdosi

Replying to @MichaelYeadon3 @PatterZone and 17 others

Well, a PCR positive doesn't tell much about infectiousness, especially not in the 25-34 cycle zone. Below 25 it's likely that the person is infectious, while above 34 it's unlikely. The test could be repeated after e.g. 48 hours to observe trajectory & to set isolation days.

Yes, I think you're right. Surely it would be technically possible to capture the cycle number along with the test results. The person to interact with here is @carlheneghan if Oxford's Centre for Evidence Based Medicine.
You've hit the nail on the head: <25, yes. >35, no.

If anyone technical, and involved in PCR testing, spots anything labelled or implying "pan-coronavirus', for the love of God, please find sometime to tell about that. It's no business being anywhere NEAR the PCR machines at a time like this.

many Covid cases and that won't happen.

12 25

SAVE THE HUMAN FACE @RamblingRingo · 9h
Why? For most people, it's a mild illness; for a minority, it's on par with a flu; less than half of 1% die from it, mostly people around the age of average life expectancy. As immunity spreads, it's no longer particularly infectious. Why are we destroying our economy & society?

4 6

G. Pedliham 2 @GPedliham · 6h
"No longer particularly infectious".
The R is rising dramatically.
In other words you are talking nonsense.

2 3

SAVE THE HUMAN FACE @RamblingRingo · 4h
No. The testing is increasing and throwing up false positives. Positive tests ≠ cases. A case is when someone gets infected and ill.

2 2

G. Pedliham 2 @GPedliham · 4h
It isn't. You're talking nonsense.

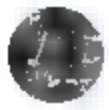
If we all restrict ourselves just a little bit then cases hopefully won't rise and people with cancer and other conditions can get back into the hospitals. Too many Covid cases and that won't happen.

12 25

SAVE THE HUMAN FACE @RamblingRingo · 9h

Why? For most people, it's a mild illness; for a minority, it's on par with a flu; less than half of 1% die from it, mostly people around the age of average life expectancy. As immunity spreads, it's no longer particularly infectious. Why are we destroying our economy & society?



4 6

Helen @helen_barnowl · 6h

We have no guarantee of immunity. Plus it was the sheer volume all at once that was the issue. I have friends in their 40's who have been left with long term issues from Covid. People who cannot work and that affects the economy too.

Great response. Thank you so much. You are spot on. I think they see a vaccine as a 'get out of jail' card. And to have full immunity too....Job done. In the mean time they keep the fear level topped up with ridiculous restrictions.

1 2

Yardley Yeadon @MichaelYeadon3 · 1h
What's even more tragic than their poor behaviour is, and they don't even realise it, that the mere existence of a vaccine isn't a get out of jail card. Few vaccines are fully effective in all those to whom it's administered. I expect only a small minority might decide to...

Rather than opinion and based purely on science, there is no longitudinal study which shows face masks provide any protection in the general population. Indeed, studies state that they can cause health problems. Mask wearing has been a political not a scientific decision.

2 2 23

If you're serious about this, please would you read & understand this study?
I believe it's the largest, longest randomised clinical trial bearing on the topics at hand.

I'm sorry to say, unless we want to repeat the horrors of the last six months on a larger scale, the time for aggressive lockdown is NOW.

Avoid unnecessary travel, work from home if you can, wash your hands and wear a mask. Protect the NHS.

2.1K 4.6K 16K

Yardley Yeadon @MichaelYeadon3 · 7h

The evidence is unequivocal & clear. U.K. lockdown did not impede the progress of the pandemic. It's unreasonable to argue
"I know, it was all costs & deaths last time, but trust me. It'll be useful this time..."

Not interested in debating facemasks. If the medics *actually fighting this* ask - even if it only gives a tiny benefit, then we should do it. Ignore the knuckle-dragging columnists bleating about freedoms or we'll be in the same position a year from now.

398 141 765

Yardley Yeadon @MichaelYeadon3 · 21m
I might try just once to illustrate not only the paucity of evidence supporting the use of masks, but the active evidence demonstrating lack of efficacy.
But then having spent over 30y involved in generation & administration of engineered aerosols probably disqualifies me.

2 18 77

GF Images @GF_Images · 2m
Thanks. And also if masks did work why did covid spread equally in Asia and japan where they've been using them consistantly for a long time?

1 1

Yardley Yeadon

The Coronavirus (Retention of Fingerprints and DNA Profiles in the Interests of National Security) (No. 2) Regulations 2020

The Secretary of State makes the following Regulations in exercise of the powers conferred by section 24(2), (4) and (8) of the Coronavirus Act 2020(1).

The Secretary of State, in accordance with section 24(3) of that Act, considers that coronavirus is having, or is likely to have, an adverse effect on the capacity of persons responsible for making national security determinations to consider whether to make, or renew, national security determinations and that it is in the interests of national security to retain the fingerprints or DNA profiles as provided for in these Regulations.

The Secretary of State has consulted the Commissioner for the Retention and Use of Biometric Material in accordance with section 24(6) of that Act.

Citation, commencement and interpretation

1.—(1) These Regulations may be cited as the Coronavirus (Retention of Fingerprints and DNA Profiles in the Interests of National Security) (No. 2) Regulations 2020 and come into force on 1st October 2020

(2) In these Regulations, "the first retention Regulations" means the Coronavirus (Retention of Fingerprints and DNA Profiles in the Interests of National Security) Regulations 2020(2).

Interesting idea, but I believe I can show it isn't that in two sentences.
Almost everyone interacts with the healthcare system (including dentists) each year or, less commonly, a few years.
Harvest DNA then, under guise of tracking unusual bacterial strains in the community.

Many ways of explaining anything. The point is that Gupta proposed an inherent and dissemination of immunity from the start which was going to make the virus a fizzle. Clearly not so. Gomes proposed that heterogeneity would provide cover at a bargain price. Apparently not so.

If there was herd immunity, foreign introductions would not be a problem. The special factor is opening up and contact tracing resources. There is a good comparison of New York and Madrid that is germane.

There is almost certainly some population immunity (as distinct from "a HIT") & was before the arrival of the new virus. It will have been increased substantially by the infected fraction during the 'episode' to date (I'm not waving it :)
That said - it's clearly insufficient.

Not interested in debating facemasks. If the medics *actually fighting this* ask - even if it only gives a tiny benefit, then we should do it. Ignore the knuckle-dragging columnists bleating about freedoms or we'll be in the same position a year from now.

Yardley Yeadon @MichaelYeadon3 · 2h
I might try just once to illustrate not only the paucity of evidence supporting the use of masks, but the active evidence demonstrating lack of efficacy.
But then having spent over 30y involved in generation & administration of engineered aerosols probably disqualifies me.

If this theory bears out, researchers argue, then population-wide mask wearing might ensure that a higher proportion of Covid-19 infections are asymptomatic.

I prefer where possible in moving from an hypothesis to go empirical, if possible, and the infection studies trump isolated particle distribution work, I humbly propose. When something doesn't work in practise, appealing to theory doesn't move us forward.

I try, but in truth, I'm not touching the mask debate beyond here, because it's a distant priority behind proper infection testing & our battle to better understand where we are with this virus. And potentially vaccines, too.

Honestly, one of my favourites is when someone who has clearly not read a single review of the field jumps on me, brusquely reminding me that "course they work, you idiot, which is why Surgeons wear them", etc. That application is really an eye opener.

Nikki Taylor --No Mask! @BrennansPrayRug · Sep 9
I can't emphasize enough what a screwup these guys did. Fauci and Redfield published a paper early on in pandemic, stating asymptomatics will count as "cases." The entire world read it, and followed suit. Now we have lunacy of Cases!!!™ driving everything

And
It's
Wrong.

1

Will Merthon @WMerthon · 9m
I think you're making too much of it. It could have been worded better, but I dont think the entire world changed their policies over 1 sentence in an editorial.

It's also a stretch to say that cases are driving everything... the death tolls have clearly had the most coverage.

It may already be weeks too late. Average age of casual care home workers? Peak age band current PCR positive?
Lockdown didn't protect care homes, because they're not really open anyway. An alternative care strategy could be tried, if anyone would do it, & that's staff live in?

His explanation of Sweden was also a lie. He lied at least two other times; on R, where whatever it is now, it's not R0, and "it never stops climbing". WTF does he call our spring then? It turned and started falling, before lockdown.

EvaNobdy @ENobdy · Sep 7

What are your thoughts about testing? Do you find it justifiable to test asymptomatic people? Do you think that testing kids because they have temperature will cause prompt schools closure?

1 1 2

EvaNobdy @ENobdy · Sep 7

If a child will be caught with temperature at school, it will be send home and asked to take test. If its a positive, then a whole bubble will be tested and if they find another case then whole school will be closed and tested. Virus doesnt affect kids and they dont spread it.

I would now not include that. I was angry. Cool, well-argued opposition is much preferred.

However, though a jarring note, it was correct. Children, certainly primary age, are not involved in transmission.

Very eloquently expressing the reservation of many people.
Not anti-vax in general but anti rushed through trials.

1 12

Yardley Yeadon @MichaelYeadon3 · Sep 7
Exactly that. I'm generally pro-properly researches vaccines.

I distance myself from those who are anti-all vaccines.

3 1 8

Becky With The Good Hair @BeckyJohnson222 · Sep 7
I am considered anti-vax (I self-identify as an ex-vaxxer)
and I'd like to point out that Gardasil was rushed too.
It didn't go through all the trials, but was fast-tracked.
And Merck never went back to do the trials following licensure.

Really not? That's dreadful. I thought national regulators compel innovators to complete whatever the regulator set as conditions of the approval.
I reviewed the public data & concluding that my daughters, then young teenagers, should receive it (was offered thro their school).

FYI. I am deeply concerned about the rushed & abbreviated devlpmt of vaccines vs SARS-COV-2.
I've stated I'm FOR vaccines that are properly developed & address important medical needs.
This thread supports that stance as a real world example.
No one can say I'm an 'anti-vaxxer'.

Honestly, one of my favourites is when someone who has clearly not read a single review of the field jumps on me, brusquely reminding me that "course they work, you idiot, which is why Surgeons wear them", etc. That application is really an eye opener.

8 72 198

Patrick Pyper @pyperpc · 2h
"Of course they don't work you idiot, that's why surgeons don't wear them" is the proper response, FRCS.

Tee hee!
Actually, 2 things. You'll find surgeons do often still wear them (I don't have stats) but in large part it's to reassure patients!

Also, in certain ops, where stakes are higher, they're still used (notwithstanding this data).

Humans like "common sense" even if wrong.

Masks aside, interesting stat from last year:
"Australia has just suffered a severe flu season, with 299,211 laboratory-confirmed cases, at last count, and 662 deaths".
That's a case fatality ratio of 0.2%. Obv we don't know how many asymptomatic infections there were.

> **GB** @graemeburton

This is awful. It's resulted in excess non covid19 deaths of people much younger than the median covid19 death (84F, 81M).

I've no way to estimate these excess deaths IF NHS continues like this til March.

Does ANYONE have a rough estimate?? I'll use it if well founded.

Why are we accepting measures which people not even needing scientific qualifications to recognise (a) are ineffective & (b) are a 'net harm'?
Is this the motive behind legal challenges? Is this even the best tack to take?
(No idea what options exist).

3 3 3

Yardley Yeadon @MichaelYeadon3 · 2m
I ask because shockingly I recently learned that poor access to NHS isn't an accident flowing from measures in spring. No, to remain 'covid-ready to manage the 2nd wave' is literally the NHS #1 priority. I've seen it on slides used in senior mngt presentations.
This will result..

I am incandescent that Govt has decided not to share with us their lethal calculus, assuming they've even run it, that says "fewer lives will be lost this way".
In any case, the Imperial model is SO wrong that any calculus based upon it also arrives at an erroneous outcome.

Hello, can you help me find something said by Prof Chris Whitty or a quote attributed to him?

I can't find it. Perhaps he didn't say it, but I recall him:

"accepting that the infection rate of Covid19 had peaked & was falling BEFORE lockdown".

Anyone? Thanks 🙏

4:08 AM - 13 Sep 2020

1

Yardley Yeadon @MichaelYeadon3 · 27s

I'm thinking it was said in an exchange at a parliamentary select committee. There are lots of these & lots of hours of hearings.

Population of Sweden is 10 million. The population of the UK is nearly 68 million in highly populated communities. You cannot compare the two countries. The same can be said of NZ where population is 5 million.

Replying to @HelenDrummond19 @AAkinsella and 3 others

It's not a numbers issue. It's about the proportion of a population which are susceptible to the infection. That's nothing to do with size. On a per capita basis, our profiles (UK & SWE) are close. Sure, it could be argued that one area could have all the immunity, but unlikely.

This is the best quality evidence anywhere, examining whether masks vs face coverings reduces respiratory virus transmission. The answer is clear. NO, they don't. Worse, face cloths INCREASE lung infections by 2-fold & is lab confirmed.

teenagers, should receive it (was offered thro their school).

1 1

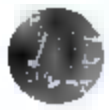
Yardley Yeadon @MichaelYeadon3 · 10h

I explained to them separately the risks of exposure to HPV which is endemic & readily transmitted during sex. The virus is thought responsible for 70% of cervical cancers.
Both girls elected to receive it.
(I do not now nor ever worked for Merck).

1 1

Yardley Yeadon @MichaelYeadon3 · 10h

I've just checked & the research phase took 15y!! >50% teenage girls receive Gardasil or Cervarix. The cost is less than healthcare costs associated with virus induced cancer. The safety profile appears to be remarkable.
I'm happy that, together, our daughters made good calls.



5 8

Duncan Cragg @duncancragg · 10h

HPV is the one I wouldn't let my daughter's have under any circumstances. It's a completely unnecessary vaccine with a shocking safety record and evidence it increases cervical cancer.

Absolutely. I will face punishment rather than accept mandatory vaccination.
To be clear, I don't lean on anyone regarding medical choices.
I've enough medical errors wrought my own body to think we know better than others.

out to have been plucked out of the air.

The 15% is not what I would call heart damage. It is the stuff that is seen with the common cold too.

1

Prof Darrel Francis **Mk CardioFellows Great Again** @ProfDFr... · 2m
And as for the lung 30%, remember this is not from Covid.

It is from SARS and MERS.

For example here is the source they use for SARS.

Table 1 Results of serial pulmonary function tests and respiratory muscle strength among SARS survivors (n = 110)

Parameter	3 months	6 months
FVC (% of predicted)	104.5 (95.0–114.0)	104.5 (95.0–113.0)
FEV_1 (% of predicted)	108.0 (99.0–118.5)	106.0 (97.8–116.0)
TLC (% of predicted)	104.0 (93.3–115.8)	108.0 (98.0–117.0)
VC (% of predicted)	105.0 (95.0–115.5)	105.5 (95.0–113.5)
RV (% of predicted)	108.0 (70.5–140.8)	115.0 (84.0–139.8)
TLCO (% of predicted)	98.0 (88.5–107.0)	95.5 (85.0–106.0)
KCO (% of predicted)	106.0 (98.0–115.5)	110.5 (100.0–119.0)*
Pimax (% of predicted)	104.0 (88.0–127.0)	101.0 (87.5–125.0)
Pemax (% of predicted)	74.0 (62.0–86.0)	77.0 (59.0–86.0)

I read last week a review which to date had not found good quality evidence that any post viral syndrome or issue was worse, longer lasting or more prevalent after SARS-COV-2 than after influenza. I don't doubt both can have unpleasant sequelae. So far though, nothing remarkable.

If there was anything dramatically different after Covid19 than after influenza, I expect it would already be known. A priori there's nothing which would make anyone expect worse outcomes. Definitely redo viruses can compromise you for months, but full recovery is usual in time.

The issue is quite easy & conventionally done. You run the assay with samples known NOT to contain virus. You do it thousands of times under varying conditions & eventually determine the rate at which it returns a positive. That this hasn't been done is criminally negligent.

Maybe they find it difficult to discuss testing accuracy for a virus that still hasn't been proven to exist?
It'd give me a migraine if I had to justify all the outright lies for the last 9 months.

1 1

Yardley Yeadon @MichaelYeadon3 · 2m
The issue is quite easy & conventionally done. You run the assay with samples known NOT to contain virus. You do it thousands of times under varying conditions & eventually determine the rate at which it returns a positive. That this hasn't been done is criminally negligent.

While kids can give flu to grandparents, it's also true the other way.
If anything, the general rule of thumb is "the most vulnerable are impacted first".
I do not believe this hype. I think it's wholly due to preferential testing in 20-29yo.

If it was possible to segregate virus by age, with say 20-29yo leading, over a pandemic, you'd expect peak illness & death, whether rare or common, to occur a a range of dates. That's not what happened. In any country, peak deaths was the same date, whether you're 40 or 80+

An attempt has been made to estimate the likely false-positive rate of national COVID-19 testing programmes by examining data from published external quality assessments (EQAs) for RT-PCR assays for other RNA viruses carried out between 2004-2019 [7]. Results of 43 EQAs were examined, giving a median false positive rate of 2.3% (interquartile range 0.8-4.0%).

I ask SAGE, PHE, Hancock again.

Why aren't you re-testing your swab PCR positives.

They're 2% of daily tests. You could easily re-test positives.

The answers would be very useful.
That you're NOT doing the normal, gold standard leads people to think you're hiding something.

This video isn't deeply scientific but their statements are correct.

We do need to understand the "cases" climbing sharply. I think it's mostly false positives but I don't have sufficient info on the FP rate to be 100% sure. Working on getting it - from the insiders.

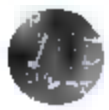
Then they need to get off their arses and spend 10 minutes researching it and disabuse themselves of that misconception, let me help them start:

2 2 3



Yardley Yeadon @MichaelYeadon3 · 5h
Being specific, I believe that THEY have no rationale to predict a 2nd wave. None at all. The docs've followed Govt/media 2nd wave fear-porn. Docs've made no individual enquiry. Note well, next time you hope they'll be awake to your unusual illness (unlikely, based on this evid).

1 1 4

John Watkinson @dalesyokel · 3h
This is typical Guardian makeitupinthecoffeebreak bollx. What do 80% of Medics think causes the classic epidemic curve? Do they believe it is only due to "social distancing"? Surely not.....pleeese.

This is a remarkable discussion document that draws heavily on SARS-COV-2 PCR testing data, notes that no arm of Govt has acknowledged that there is such a thing as a false positive rate & appears not to have bothered to have determined it.

15 111 214

Steve mab Cymru @freewelshspirit · 4h
Surely this is a question for MHRA if the FPR is 99% which I believe it is. Imagine if a pregnancy test was being marketed with a FPR of 99% ! The test kit would be withdrawn from the market.

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @freewelshspirit

Quite. The current PCR test on swans as used in Pillar 2 community screening is not fit for purpose.
This based on there being no stated false positive rate. No assay can be used in surveillance role without this crucial number.
So why IS it being used?

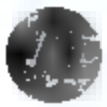
The Irish HSE acknowledges they use 35 to 40 cycles. Their defense is 'we cannot distinguish load coming up or down so must try to capture presymptomatics'. This would perhaps be fine if tests were not is reported as 'cases'?

1 7

Yardley Yeadon @MichaelYeadon3 · 3h

Indeed, Carl Heneghan argues all they need do is test again in a few days, if still positive, is cycle threshold falling? They've getting ill. Rising? Cold positive. Negative? False positive.
It's doable as only 2% of tests need follow up.
Why aren't they doing this?



1 14

Paul Winter @Batshitcrazy69 · 6m

2% positive test rate? What's the false possitive rate @ 30+ cycles ?

1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @Batshitcrazy69 @ReneRunCoach

I genuinely don't know. PCR doesn't automatically go rogue if run even 45 cycles. But the risk it's detecting something other than intact virus does rise at high Ct, because even one, partial RNA strand matching the primer can amplify to a positive.

Sir Sweden Got it Right QC @FunTimeFred1 · 2h
That's a good thing

If folks DON'T have symptoms, they should NOT be tested

If they have symptoms, do what we have done for decades, STAY HOME UNTIL YOU FEEL BETTER

If they have symptoms and are in a high risk category, GO TO HOSPITAL

1 3 7

Eleanor Blair @lnr_blair · 1h
Two of us have symptoms. So either we get a test, and can rule it out quickly (or in!) or all three of us stay home for 14 days. Also if it *is* covid then we have already potentially exposed everyone at school and work, and they need to know, so *they* don't keep exposing others

1

Sir Sweden Got it Right QC @FunTimeFred1 · 54m
Assume your symptoms are mild & no underlying conditions, otherwise you'd be seeking medical help

Find it incredible to have to explain, but more folks exposed to virus is GOOD when no corresponding high deaths or hospitalisations (as we've had for 8wks+) - it's called immunity

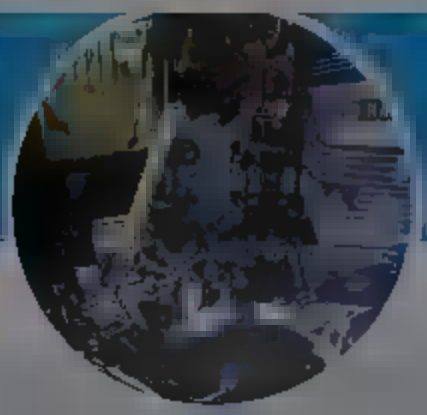
It's all totally irrelevant.

It is clear, and Vallance knew long before this fabled email exchange, that peak infections had passed & was slowing BEFORE lockdown.



It's been shown compellingly that 'leaky lockdown' made ZERO difference to the timecourse of the pandemic.

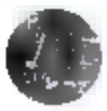
Thanks. What should we do if anything? In some ways there is nothing new here – these are all arguments that have been put before. The one thing on herd immunity is I did make it clear at the select committee that ultimately herd immunity is what is achieved by vaccines and that is what stops epidemics but I just don't think it is worth going back again on that.

If you see the CCS paper produce in Feb it is very clear what we warned of and what needed to be prepared for.

It is also the case that I argued stronger than anyone for action for lockdown (with a telling off from CMO, PS DHSC and CabSec)

Is there anything we need to do or just keep quiet?



Patrick

76 1.2K 1.9K

Ollie @olliejb1981 · 5h

The decent thing to do here is clearly to let herd immunity happen for the fit and healthy of society to reduce the amount of vaccine required and let the bedwetters and those genuinely vulnerable quarantine and hide away until there is a vaccine to make it safe for them too

Surely this is a question for MHRA if the FPR is 99% which I believe it is.
Imagine if a pregnancy test was being marketed with a FPR of 99% ! The test kit would be withdrawn from the market.

Yardley Yeadon @MichaelYeadon3 · 2h
Quite. The current PCR test on swans as used in Pillar 2 community screening is not fit for purpose.
This based on there being no stated false positive rate. No assay can be used in surveillance role without this crucial number.
So why IS it being used?

1

Steve mab Cymru @freewelshspirit · 5m
Maybe the govt and public health are still in crisis management. At the start a few extra false positives didn't matter when the prevalence rate was high. Now it is low the FPR makes a dramatic difference. This points to incompetent management but can anyone be that incompetent ?

1 1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @freewelshspirit

Precisely right.
As the 1st June internal paper on the PCR test says.
They warned that in population screening mode & low virus prevalence, even a low false positive rate is a complete & self inflicted disaster.
THIS is where I believe we are today.

2. We have suppressed the virus for sure by NOT LIVING. But suppressing the virus does not kill it or send it away. It does just that; suppresses it. And so, it follows, that as soon as you start living, the virus does its thing and starts spreading. Inevitable.

3 27 175

Renee Hoenderkamp @DrHoenderkamp · 4h
3. So what was the plan? To get a vaccine? Allegedly. But also not to overwhelm the NHS. I have two thoughts here. This was not about humans, it was about PR. The UK govt did not want pictures of people lying on NHS hospital floors. (nor do I, but from a human perspective).

2 17 139

Renee Hoenderkamp @DrHoenderkamp · 4h
4. Vaccines; I don't believe we will get one. And if we do get one, I will not be having it (I am pro vaccines) but because a rushed vaccine will not meet my safety criteria, its no. Swine flu was rushed out and a % of people get narcolepsy. This is fact cdc.gov/vaccinesafety/...

#COVID19 is capable of infecting others and is therefore very much a "case".

9 1

Sir Robert Syms MP @RobertSyms · 31m

Actually not the test is so sensitive it picks up many who are non infectious - the Govt are looking at this I am told by Matt Hancock there needs to be a cut off point where people with small viral loads are discounted.

5 11 57

Kris Wigfield @KrisWigfield · 29m

Excellent point, not to mention the false positives. Which would presumably be far less prevalent if people with no symptoms didn't take tests.

1 1 16

Alistair Haimes @AlistairHaimes · 21m

I think a lot of the non symptomatic tests are door to door etc in hotspots? Hopefully a sensible cycle cut-off will discount these

Yes, mass testing of well people.

Tens of thousands of them.

Hancock pretends people getting tested have symptoms.

He lies.

I ask SAGE, PHE, Hancock again.

Why aren't you re-testing your swab PCR positives.

They're 2% of daily tests. You could easily re-test positives.

The answers would be very useful.
That you're NOT doing the normal, gold standard leads people to think you're hiding something.

> **Yardley Yeadon** @MichaelYeadon3
> Replying to @ReneRunCoach
> Indeed, Carl Heneghan argues all they need do is test again in a few days, if still positive, is cycle threshold falling? They've getting ill. Rising? Cold positive. Negative? False positive.
> It's doable as only 2% of tests need follow up.

15 118 253

Peter Duckworth @GrumpyPete · 6h
I think you'll find they don't have the testing capacity. Bury have just closed two of its testing centres

2

Yardley Yeadon
@MichaelYeadon3

datatosee.com @dontbetyet · 6m
The death problem relates to admissions to. If tested while in hospital and positive you are classed as an admission even if you are in for say a broken leg. Also if you had a positive test 14 days prior no matter what that's an admission to.

datatosee.com @dontbetyet
There are still problems with that. Needs to be something like NHS admissions with COVID-19 symptoms. You can have a positive test be in hospital but not being treated for COVID but you are still counted as an admission…

Yardley Yeadon @MichaelYeadon3 · 7h

I really respect this doctor & human being for speaking out, eloquently.
It's the strongest testimony you'll find to demand Govt just STOP smashing the country up, allow NHS to do its stuff. The pandemic is essentially over, has been for months.
Just the false positives to sort.

> **Renee Hoenderkamp** @DrHoenderkamp
> This is going to be long. Its time to bring all of my thoughts about Covid and the governments response to it, into one thread. Because separately they may seem conflicting. So bear with me. I write this as a human being, a mum, a relative of older/sick people I love and as a GP.

But then doesn't the seasonal flu count? I'd have thought numbers would need to play a significant role; there'd have to have been so many people dying that we'd all know several who died OF covid (not "with" it.) Had Ferguson's predictions been anywhere NEAR truth, then yes.

1

Yardley Yeadon
@MichaelYeadon3

I don't believe either in tea leaves or conspiracy. Our 'leaders' are too incompetent to conspire to make a sandwich without it landing, face down, on the carpet!
Usually, easier explanations can be found for odd coincidences but I'll concede they're usually deadly dull.

1 1

Alberto Thomas @AlbertoThomas · 6m
How many coincidences before it's mathematically impossible?

1 1 1

Yardley Yeadon

It's very unusual to die from a respiratory virus infection longer than a few weeks post infection, VERY.
There will be some missed covid19 deaths with 28d cutoff.
But FAR fewer erroneous covid19 deaths this way. By far the best compromise.

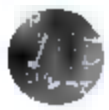
JOSE GEFAELL @ChGefaell · 20h
@ildefonsog_
Currently mild and asymptomatic cases are 96% in Spain. Once the disease is over, in the following months pieces of inert virus can be found in their mucous membranes, so they would be susceptible to have a false positive in subsequent PCR tests. (1/2)

6 67 221

JS @JonSykesNbr1 · 9h
Exactly the same thing is happening here with tests set at too high a sensitivity (UK).



We are also getting constant fear warnings about a deadly second wave overwhelming Spain.....

1 3

Jeremy Hume @jeremy_hume · 9h
The so-called new normal, in which the Boris Johnson dictates how many people you can peacefully interact with, is dystopian. Am I the only one who is genuinely more worried about government overreach than COVID-19 (a disease with a 99.5%+ recovery rate)?

1 5

I'm not sure cases matters, not at least until we can satisfactorily resolve the false positive rate. In U.K., I think it may be so high as to account for most mass screening positives reported since June. That deaths fall no matter what happens to cases supports that interpret.

1 15

Rob Pilling @rob_pilling · 3h
That's actually completely untrue. One of the features of this disease is the length of time people have spent ventilated on ICU. More than 4 weeks has been the norm rather than the exception.

3 3

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @rob_pilling @varjmes and 3 others

No, not true. Almost no one gets ventilated. Early on, we over used ventilators, killing hundreds. Now, it's extremely rare that someone is so ill that a high oxygen mask isn't sufficient AND ventilation is indicated. It's not a disease of obstruction.

And how many patients on ventilators the last 10 weeks Rob?

1

Rob Pilling @rob_pilling · 1h
That wasn't the Q. He said it was very unlikely to die after 4 weeks. I was correcting him. But in answer to you...hospital admissions lag several weeks behind infections. The need for ICU care can be 7-10 days after admission. Both are increasing already.

2

It's the question now. How many on ventilators as a % of hospitalised patients? Now how many cases are hospitalised as % cases. It's very unusual to spend multiple weeks on ventilators. I'm talking (a) good practise & (b) since it was realised that ventilation is rarely indicated

DECENTRADICAL @DECENTRADICAL · 20h

And if they can't find any they increase the sensitivity of the tests.

The real problem starts when they start conflating flu deaths with covid19 deaths.

1 11

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @DECENTRADICAL @ChGefaell and 2 others

If enough people are tested per month then, given 2% per round are thought false positive, it's not long before people genuinely suffering from flu will also be considered Covid19 "cases". All killed by flu will be Covid19 deaths. It's nuts. We rarely conduct PCR on flu cases.

Why would I watch a video on medical matters from someone who is NOT a medical expert??

2

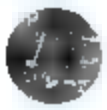
Sniff Snuffkin @djganners · 11h

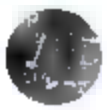
Wow cos look where the medical "experts" have got us! Sometimes you need different perspectives, or you could just stay ignorant



2 2

Steven Wood @StevenWood1982 · 11h

Herd immunity is a myth that has no basis for scientific fact whatsoever and is unsupported by any peer review study ever conducted.. So why listen to a BS video that has no scientific basis other than the odd doctored graph here and there??



4

Yardley Yeadon @MichaelYeadon3 · 1h

That's a shame since there's no question it's herd immunity which turned the expanding pandemic everywhere.
You didn't think it was lockdown did you?

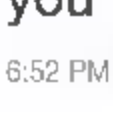
masks have a benefit and that's not even up for discussion, it's fact. You can argue it all you like, I don't care

1



GizzymeetsDudds @gizzymeets · 3h

Well clearly you do care or you'd have stopped replying by now?

However in your head, you rise to a challenge and hate to be told that you "could" be wrong.

Even though part of your argument could be relevant...your stubbornness won't let you accept a different point of view.

1

Shinobi @cannotbefussed · 3h

There is a huge consensus that masks, along with the other precautions we can take, will help mitigate the risk. I'm not daft enough to dismiss them on the basis it takes some freedom away or some other reason. I don't want to argue with you, in all honesty. Hospitals are filling

mention a particular standard of mask. Namely FFP3.

How many members of the public wear those?

2 1

Shinobi @cannotbefussed · 4h

I've got a fair idea I am, you dished out insults fairly quick, so my assumption will be pretty spot on. I'm not arguing what the public are wearing, I'm saying masks have a benefit and that's not even up for discussion, it's fact. You can argue it all you like, I don't care

Beyond this case, others thought to be reinfected we're not ill in any way.
It'll be a quirk in their immune system. It definitely doesn't happen, for all practical purposes.
As to duration of immunity, I'm going to guess >17y. That's how long immunity to SARS-1 lasted so far.

We DO NOT KNOW about immunity OR how long it lasts.
If 2nd incidence was worse than 1st, perhaps more had a mild case initially and 2nd case was worse and documented?
Long lasting effects?

Children are able to acquire the virus but are generally not made ill by it. Unlike flu, now much more prevalent than SARS-CoV-2. They rarely transmit it, either, unlike flu, where children are considered major vectors to older relatives.

Blair, Hunt & Haig are co-authors on a country wide mass testing proposal in which we'd all need to be tested 3x per week. Doc is public domain.

I get the impression from scientific advisors that the worry is being seen to lockdown too late 1st time and how keen they are to act now to avoid that accusation again. Admissions are creeping up but has sufficient account been taken of the harm to health these measures cause?

Earlier lockdown would either still have had no effect or would have had us STILL in lockdown. Lockdown is an ignorant policy because there is no exit strategy.
We've forgotten what we've learned. We once thought this was 30x more lethal than flu. It's actually within 3-fold.

I think the impression that SAGE comprises unimaginative & narrow scientists is accurate & by design.

There will be no help from SAGE. I was last week contacted by someone claiming to be a friend of a SAGE member.

They desperately need help. Since I replied, it's gone dark.

Until testing is only done as a verification of symptoms following medical consultation this will continue. By my reckoning we are testing more than most other countries in the world we are allowing people to book tests when they don't have symptoms causing a huge error rate.

1 11

Yardley Yeadon @MichaelYeadon3 · 27m
Even If they've symptoms they're unlikely to have covid19 EVEN if they test positive. It's not the public's fault they don't understand this, but foul people running it do.
If prevalence is 0.1% but FPR is 2%, with a positive test, you're *95% likely to be clear.
(*Help valued!)

1 2 8

Matthew Evans @mjamesevans · 19m
Surely the @CMO_England and @uksciencechief understand this even if blinkered politicians don't. Why is this being peddled as a solution as far as I see it is only making the situation worse and increasing panic.

1

Yardley Yeadon
@MichaelYeadon3

Replying to @mjamesevans @CMO_England @uksciencechief

If they do (& I'm not sure Whitty does) they've done nothing about it since 1st June, when a highly critical internal report went to SAGE. Minutes of next SAGE showed that the issue wasn't discussed. Wilful blindness? Deliberately leaving FPR undeclared?

Hunt on BBCR4 asserting "that only when everyone in the country can be tested for SARS-COV-2 several times a week can we get back to anything approaching normality".
Wrong. Cease mass testing with an assay of unknown false positive rate. If FPR is 2%, 99% of 'cases' are false.

50 144 344

Mark Davison @Fuengi · 1h
False Positive Rate is higher than 2% I assume, do we have any idea Michael?

Does this also take into account the "cases" that are detected past 25ct or are we still including those as correct positive?

1 1

Yardley Yeadon
@MichaelYeadon3

Follow

Replying to @Fuengi

We don't know. Govt refuses to a acknowledge that FP exists. 15w ago, an urgent report on topic went to SAGE. Ignored.
I only know what the report said: similar assays had FPR not lower than 0.8% & not larger than 2.6%, in well controlled labs. 2% is a conservative estimate, IMO.

Since the number of positives have nothing to do with the infectious state of those swabbed, it's clearly going to go wherever it's authors want it to go.

IF another lockdown looms, we must all peacefully demonstrate in our hundreds of thousands in a socially distanced manner.

> **Robert Peston** @Peston
> Tougher social distancing measures loom in just two weeks if Rule of Six does not change our behaviour and if rate of virus spread does not flatten, I understand itv.com/news/2020-09-1...

Sadly, it's become tribal, where millions believe we should not be reimposing restrictions but lifting them, yet won't come out and say it because they see Covid sceptics as uncaring, Brexit type loons.

Amun Ra @KevinMcVann · 33m
Replying to @MichaelYeadon3 @jenninemorgan
Once again we are ALL being Punished because a Certain Group Refuse to go by the Social Distancing Rules just look to where the latest spikes are to find that answer

No, but pressure has been apparently successful in that we're reasonably confident that the interval instruction to revise the test post dated various inputs to SAGE & NHS senior management.

Yardley Yeadon @MichaelYeadon3 · 4h

Hunt on BBCR4 asserting "that only when everyone in the country can be tested for SARS-COV-2 several times a week can we get back to anything approaching normality".
Wrong. Cease mass testing with an assay of unknown false positive rate. If FPR is 2%, 99% of 'cases' are false.

81 280 692

Peter Duckworth @GrumpyPete · 3h

Is this man insane? First they need a reliable test that can be administered at home, I don't believe anyone is developing one. Second you need to persuade 66m plus illegals to test themselves several times a week which is impossible.

No persuasion needed. You won't be able to go to work or into a shop unless your covi-pass (TM) shows a valid negative no older than 48h.

As if "testing everyone in the country for SARS-CoV-2 several times a week" is even remotely anything approaching normality . . .

For a respiratory virus which is akin to a nasty kind of 'flu

It's far less bad for most than that. The very strong age bias means most people of working age are not classical vulnerables. These people need protection. Not the other 95% of the population.

Please read on CEBM website "how many positives" article by Carl Heneghan. It's really simple but much easier to see a written example.
Even a 0.1% FPR returns 50% of the positives being false.
I'll bet £1000 that operational false positive rate Pillar 2 is way larger than 0.1%.

We have a property in France. Plan was to enjoy winters there & sell the Kent home in a decade when we're 70.
Might pull that forward.
I also have deep misgivings about being mostly in sterling denominated assets.

Am I alone?
The more Govt does re covid19 the more unsafe I feel.
They're dangerously incompetent & have no ability to back up if they've gone astray.
I would feel happiest if they just stepped back, reopened the NHS, then went on a 6mo vacation. I hear Antarctica is nice.
